The "corrugated wheel, of Messrs. A. Whitney & Son," exhibited at the Fair, and receiving the medals, of the American Institute, is cast in one piece, and requires only boring out to be ready for the axle, and from experiments made is found, from their peculiar mode of making wheels, to be entirely free from the strain arising from the ordinary mode of casting wheels whole on a chill. The peculiarity of their process we understand to be in cooling their wheels in a hot oven, or furnace—by which every part of the wheel is kept at a uniform temperature until the whole is cold. Ten or twelve wheels, while red hot from the mould, are put into this oven, or furnace—which is about four feet in diameter and seven feet deep, with a moveable cover—heated to a high temperature, where they remain 36 to 48 hours, the whole mass cooling down gradually. Our first impression was, that the heat of this furnace would im-

pair the chill, and so expressed ourselves, but were informed to the contrary, and examined fragments of wheels which had been broken to test their strength and quality of iron, which apparently retained the chill perfectly.

Messrs. Whitney & Son have made numerous experiments upon various kinds of iron, for the purpose of arriving at useful and profitable results in the manufacture of car wheels, a branch of business in which they are now engaged; and those who have known the seignor of the firm, whether as manager of railroads, or canal commissioner in the State of New York, or as one of the late well known firm of **BALDWIN & WHITNEY**, locomotive engine builders, will not doubt of their ability to furnish as good an article as any other manufacturer in the country, aside from any peculiar merit which their new form and mode of manufacture may possess.

We understand that they offer to furnish a set of their wheels to any road without charge, or expense to the companies, unless they prove to be what they are represented.

Western Railroad, a 19 mos.....	113½
Fitchburgh Railroad.....	126
Boston & Prov Railroad.....	105
Reading Railroad.....	28½

Such has been the unlooked for success of the Western Railroad, by way of Springfield and Pittsfield to Albany, that measures are being taken, as we perceive by the papers, for the construction of another line to the Hudson, and in continuation of the Fitchburgh road. Should this enterprise be successful, the Green Mountains—which a few years since were deemed impassable by locomotives—will be crossed by no less than four lines of Rail-

road—and probably by five—within a half dozen years.

The North-Adams Transcript says: “The attention of our community is very much awakened by the project of a railroad, in connection with the Fitchburgh Railroad, from Greenfield to Troy, by our village, forming a new and superior route from Boston to the Hudson river. Hoosac mountain is the only obstacle in the way of a road between those termini, thirty miles shorter than the Western road, and with no grade exceeding forty feet to the mile; while that road goes over a mountain 1400 feet high, on a grade of over eighty feet to the mile. The practicability of a tunnel through Hoosac mountain is now fully established. Engineers have been for some time on the route, and the indomitable energy of the Fitchburgh Corporation is felt along the whole line. Great anxiety is manifested about obtaining a charter.”

#### Railroad.

“Jonathan Knight, Esq., the well known engineer by whom much of the National road was located, has been engaged for the last two or three weeks in examining the country between Wheeling and Zanesville, with a view to determine its general features, preparatory to an accurate survey. Doubts have been entertained with regard to the possibility of obtaining a route, without departing very much from a direct line, and of course increasing the distance; but Mr. Knight reports favorably, and states that the cost of construction will be much less than was anticipated. He thinks a route can be obtained to approach Zanesville by way of Millrun, which will be in some respects desirable. From Zanesville, westward, no difficulty has been anticipated, in the matter of finding a cheap and practicable route.”—*Zanesville Courier*.

We recognise, in the gentleman here named, one of the pioneers, and a veteran, of the profession.—Mr. Knight was, we believe, the chief, or a principal engineer on the National road—on which work he established a reputation that secured for him the appointment of chief engineer of the Baltimore and Ohio railroad—to which work he devoted himself for many years. It was, if we recollect right, in 1842 that he retired from that work; since which period we have seldom heard of him, and it is therefore with the more satisfaction that we again hear of him in the field.

#### Railroads in Maine.

Extract from a letter dated “Portland, October 29, 1847.” The writer says: “We are about starting another railroad in this State, commencing at Portland, and extending westerly through Goreham and Boston, and crossing the State of New Hampshire in the general direction of Burlington, probably connecting with the Meredith and the Northern road.

“This is a highly cultivated and rich district of country, and will afford a rich return to capitalists. The right spirit prevails among its friends, and I have no doubt that it will be commenced in the Spring.

“The State of Maine is determined ere long to take her place among the foremost of her sister States in railroad improvements. Possessing more seacoast, more harbors, greater length of rivers, and more territory than all the other New England States, she must, at no distant day, attain a corresponding position in relation to her railroads.”

The route for a railroad here pointed out is to us entirely new—but we can readily see that its construction will be of great importance to Portland. The distance direct from Portland to Burlington is

not as great as from Boston to the same point, and a favorable route for a railroad may probably be found which will be shorter than the line via Concord, and the Central Vermont road. If so, it would come in for a share of the western trade, via the Ogdensburg road, which, with the way business on the line, and its proportion of the Passumpsic and Connecticut river valleys trade, will ensure rich returns upon its cost, and add largely to the business and wealth of Portland; we therefore wish God-speed to the enterprise.

#### Androscoggin and Kennebec Railroad.

The following interesting letter is in reply to one from us, asking information in relation to this road and its probable connections. It is dated—

LEWISTON, Oct. 25th, 1847.

Dear Sir,—Yours of the 12th instant was duly received, and, in accordance with your request, I send you the following account of our railroad.

The Androscoggin and Kennebec Railroad forms a part of a great interior line of railroad through the State of Maine, extending, as already chartered, from Portland to Bangor. The first 27 miles from Portland easterly, to Danville, is a part of the Atlantic and St. Lawrence Railroad, extending from Portland to Montreal. At this point, (27 miles from Portland,) the Androscoggin and Kennebec Railroad commences, and reaches the Androscoggin River at Lewiston, 6 miles farther east. Here is a fall in the river of 46 feet, affording a noble site for a manufacturing city, and it is destined ere long to be improved, a company for that purpose having been already organized, and holding the necessary lands and water privileges.

From Lewiston the Railroad extends eastwardly through Green, Monmouth, Winthrop, Readfield, and Belgrade, to Waterville on the Kennebec River. At Monmouth and Winthrop there is a considerable amount of water power upon the outlets of several large ponds flowing towards the Kennebec River. At Waterville the Ticonic Falls command the whole power of the Kennebec River, and for a distance of three miles above these, are several other falls and rapids, many of them not yet occupied. At Kendall's Mills, three miles above Waterville, is a large lumbering establishment in full operation. Besides the Kennebec River, Waterville also possesses many favorable sites for manufacturing, upon the Emerson Stream which enters the Kennebec a little below Waterville, and is the outlet of a chain of ponds or rather lakes, covering 75 square miles of surface. From the last of these, Snow's pond, to the Kennebec River, in a distance of about eight miles there is 200 feet fall. This stream is very little affected by freshets, and is never frozen over in the coldest winters. Probably few locations can be found affording so vast an amount of water power conveniently situated for use, in so small a district.

The whole length of the Androscoggin and Kennebec Railroad, from the junction with the St. Lawrence road in Danville to the Kennebec river is 55 miles. The whole road is now under contract, and operations have been going on upon the western half for some months. The road is to be completed to Winthrop, 26 miles, by the 1st of October, 1848, and to Waterville by the 4th of July, following. The excavations are not very heavy, the amount of ledge is small, and there is no reason to anticipate any delay in the progress of the work.

From Waterville to Bangor, a distance of between 40 and 50 miles, a charter has been granted to the Kennebec and Penobscot Railroad. This Company has not yet been organized, but when the railroad

west of the Kennebec river is completed, this character will not long lie dormant. The country east of the Kennebec river is very smooth, and promises one of the cheapest routes for a railroad ever found in the New England States.

A survey is now in progress for a branch of the A. and K. R. R., extending from Waterville, through Norridgewock to Anson, upon the Kennebec river, 25 miles farther north. This region comprises some of the best farming land in the State of Maine, and would bear comparison with the far-famed fertile prairies of the West. Water power is also abundant upon the Kennebec River and its branches. At no distant day, the road will be pushed still farther up the Kennebec River, and eventually will be carried to Quebec.

A railroad has also been chartered from Augusta on the Kennebec River, to Farmington on the Sandy River, about 30 miles in length. Several routes are spoken of for this road, but whichever of them is adopted, it must connect with the A. and K. R. R., and become a useful tributary to it.

Any other information you may desire in reference to the road, I shall be happy to communicate.

Yours very truly,

EDWARD APPLETON, Eng. A. & K. R. R.

#### Great Suspension Bridge in Hungary.

The stupendous bridge over the Danube, which is intended to unite the two important towns of Pesth and Ofen, is rapidly advancing towards completion. The land-piers, on each side of the river, are completed; and the two piers in the bed of the river will be ready for the chains by next spring. The chains for this stupendous bridge are being manufactured in England, and will in a short time be forwarded to their destination. The extreme length of the bridge is 1200 feet (the width of the river at Pesth); the main span, over the centre, is 600 feet; the other two spans are 300 feet each; and, when, completed, it will be one of the finest suspension bridges in Europe, and an ornament to the engineering talents of W. Tierney Clark, Esq., M. I. C. E. of Hammersmith, under whose superintendence the bridge was designed and constructed. Since the year 1840, Mr. Clark has annually visited Pesth, to inspect personally the progress of the works; and the contract for making the cofferdams was taken in the same year by that spirited contractor, George Burge, Esq. All the machinery, steam engines, cranes, crabs, etc., for the pile-driving, was supplied from England; and, from the limited knowledge of industry and mechanical powers in that country, it was found requisite to send out a great number of competent mechanics, to instruct the native Hungarians, who, under English working instruction and patience, are now an ornament to their country, as practical and efficient workmen. Thus, will Pesth Suspension Bridge stand a grand monument of English engineering, and of the first civilization of Hungary. The foundation-stone of this great national work was laid, in the coffer-dam on the Pesth side of the river, in July, 1842, by his Imperial Highness the Arch-Duke Charles of Austria; since which time the works have been gradually progressing; but the deficiency of roads in Hungary rendered it a matter of great difficulty to obtain the stone and other materials for the works. Although Hungary has vast resources of granite, and also fine stone of every description, and (near to Pesth) vast mineral resources, yet, from mismanagement, these resources are, in the present state of the country, perfectly useless. Not a single road is there in the whole country; in one

part corn is in abundance, while in the other parts they are often complaining of famine, and yet, from the deficiency of roads for communication, no relief can be given. The rotten policy of Austria is also a great check to the progress of Hungary; but the universal spreading of knowledge is making rapid progress there, and Hungary may, with perseverance, rank high as a commercial nation. From the deficiency of road in Hungary, Mr. Clark saw it would be impossible to obtain the quantity of granite required from the Hungarian quarries: the great granite quarry, near Linz, in Upper Austria, was then taken—where immense blocks were quarried for this massive masonry—many of the blocks are from 12 to 16 tons each, which form the ice-breakers of the piers in the bed of the river. These weighty masses were floated from Linz to Pesth, in clumsily-built boats—a distance of 400 English miles. The expense of the bridge, when completed, will be 6,000,000 florins, £600,000. The present communication between Pesth and Ofen is affected by means of a bridge of boats, constructed on military principles; but, on the ice making its appearance, the bridge is taken away; and, during the winter, the passage is very dangerous, and as many as 300 persons have perished in one season, in trying to effect a passage when large masses of ice have been floating down the river.

If the ARCH DUKE CHARLES had consulted us in relation to this bridge, before he commenced it, possibly we might have put him in the way, of putting us in the way, of a good speculation, as we have no doubt but that we could have selected at least two gentlemen in this country, who would build him a suspension bridge of 1200 feet, in a single span for one half the amount this one over the Danube is estimated to cost—£600,000! or \$3,000,000!! We will try, at all events, if he will give us an opportunity when he is about to build another.

#### Ocean Steam Communication, Southampton and New Orleans Direct.

"The Royal West India Mail steam packet company have entered into a contract, says the London Mining Journal, with the Lords Commissioners of the Board of Admiralty, to come into operation on the 2d November, when their vessels will proceed direct from Southampton to Bermuda, Nassau, Cat or Ship Island (New Orleans), Vera Cruz, and Tampico, returning by the same route to England. This arrangement admits of an easy and quick conveyance to and from Southampton, and the above mentioned places, and passengers for New Orleans will be conveyed thither from the company's vessels, on their arrival at Cat or Ship Island, by the Mexican Gulf Railway Company, who will have a steamer ready, and other conveniences provided for that purpose. The estimated time for the voyage from Southampton is as follows—To Bermuda, 16 days; Nassau, 21; Havana, 23; New Orleans, 28; Vera Cruz, 33; and Tampico, 35 days. By the above alteration, passengers proceeding to the West Indies by the 2d of the month steamer, will be conveyed via Bermuda, and by the 17th of the month packet, via Madeira and Barbadoes. No company has done more for affording facilities to our mining interest in Mexico, Chili, Peru, and the Havana, than the Royal West India Mail Company, whose vessels, for accommodation and tightness, are duly appreciated. It has long been a desideratum, that we should receive direct news twice a month from our mining operations in Mexico and Chili, instead of only by the monthly packet of the 7th. Arrangements are making to carry out

this grand object with the Mexican Gulf Railway Company, and the South Pacific Steam Navigation Company; and as a railway across the Isthmus of Panama is not only decided upon, but in actual progress of construction, further facilities will be thus afforded to our miners in the New World, for a quick and safe transit for the ores and precious metals for shipment to this country."

The assertion that a railway across the Isthmus of Panama, is "in actual progress of construction" is, we imagine, rather premature.

#### Buffalo and Mississippi Railroad.

We have before us a report made in June, last, by GEO. W. BALDWIN, Esq., of Charlestown, Mass., in relation to a line of railroad from Toledo to Chicago. We published in the Railroad Journal, of September 5th, 1846, the proceedings of a meeting held in relation to this work—and in the Journal of September 18, 1847, is a map, from which—although this line is not laid down upon it—the reader may see its position from the extreme point of Lake Erie to the south bend of the river St. Joseph, and thence to Michigan city and Chicago.

This report is evidently based on very indefinite examinations; but an experienced engineer can form a tolerably accurate estimate of the cost of the work, by comparing it with others over similar routes, and of like construction; and we may therefore presume that this report will be useful in guiding public opinion in relation to the work, as it contains a mass of facts and useful statistics. We are of the opinion, however, that the cost is put too low, and the estimated income—for a time at least—too high, though it cannot be otherwise than that a good road, across this peninsula, will command a large business, especially when the line shall be completed along the lake to Cleveland, and thence to Pittsburg and Philadelphia, as well as to the New York and Erie railroad.

We give such portions of the report as we think will be useful to those who desire information in relation to it, as well as to those interested in its construction.

The details of the two first divisions in Ohio are given in full, and the total cost of the remaining divisions, together with the grand total of the whole, with an 80 and a 56 pound rail.

The grades are generally favorable—though the greatest length and highest are against the heaviest trade.

The curves are very favorable—being scarcely any less than 2800 ft. radius, and 155 miles a straight line.

The advantages of this road are well set forth by Mr. Baldwin, and the relative distances and times of reaching Boston and New York by the different routes, are given in a convenient form.

The table of distances from Chicago will be found exceedingly convenient.

The estimate for business and revenue, as we said before, we consider high—at least for the present—though we admit that it may be fully realized a few years hence, as the increase of business in that region is to be rapid and constant—to an extent not duly appreciated by the people of this country.

If we may be allowed to add a word, or a suggestion, to the able report of Mr. Baldwin, we would say that he has omitted one very important argument in favor of this line, and that is, that its construction and connection with the Ohio railroads—soon to be made—will open a shorter route to tide water, at Philadelphia, via Pittsburg, than either of the others. A railroad from Toledo to Cleveland, and from thence to Pittsburg, where it will meet the

Central (Pa.) road, will furnish a shorter route, even to New York, than by Albany, and should not therefore be forgotten in enumerating the sources of business and profit to the Buffalo and Mississippi railroad.

## REPORT.

(Dated) Charlestown, Mass., June 1, 1847.

HON. H. D. MASON,

SIR: Having perambulated the railroad line from Toledo, in Ohio, to Chicago, in Illinois, a distance of 232 miles, I offer the following report upon the cost and traffic of the railroad when completed, for the consideration of yourself, Mr. WHITTLESEY, of Canfield, Ohio, and the other gentlemen, associated in the present inquiry concerning the feasibility of the project.

I ought, perhaps, before proceeding to make an apology for the incompleteness that may be discovered in some of the matter to be stated, on account of the great haste I was obliged to make in performing the duty I had undertaken, within a time limited by previous engagements; besides, the reconnaissance was made in the latter part of November and first part of December last, when the weather was extremely inclement, and the ground covered with snow for more than half the route. Notwithstanding, I feel assured, from what I saw of the line, and from the geological indications where the line was departed from; that nothing would be found in executing the work, which could seriously affect the conclusions to be drawn from the several reports, plans and profiles of the engineers who made the original surveys; which reports, plans and profiles, have necessarily been the basis of the present investigation.

The plans and profiles of the Ohio portion of the line, were missing at the time I made the reconnaissance; but their place was, in a great degree, supplied by the information furnished by Mr. Crane, of Adrian, who accompanied me as guide, and who ran the original level from Toledo to the east line of Indiana, under the direction of Mr. Hopkins, the engineer.

In Indiana, I was conducted along the line westward from Lima, by Gen. Orr, of Michigan city, who had assisted in the original explorations of the several routes surveyed in that State.

As a whole, the country over which the line will pass, may be considered unusually favorable in many respects, for so long a road—as the estimates, plans and profiles of the several engineers will show. From Toledo to the St. Josephs river, in Ohio, crossing the mill stream, Bean creek, the country appears quite flat, with the exception of an occasional slight swell or sand ridge, or depression at some of the very few streams that intersect the line. The soil on this part of the line is a sandy loam, covered at places with a deep rich soil, the whole underlain, as it probably is, by a thick stratum of clay. For the greater part of the distance, the sub-soil would no doubt be a suitable material for the road bed; but at places where the wet prairie or heavy timbered lands are passed, it might become necessary to bring from a distance, a better material for the road bed than

could be found in excavating the side drains. I am of opinion that few places would be found where a suitable substance would not be found in the drains. At the St. Josephs valley, some extra expense in embanking may be required; but for the want of profiles the difficulty, if any exists, at this place, cannot now be estimated.

From the St. Josephs to within three miles of the east line of Indiana, the country is generally level, and is heavily timbered. The soil near the St. Josephs is a sandy loam, underlain at places, if not generally, by the clay. In some excavations for wells and drains, small stones of carbonate of lime, and disintegrated shells, have been found, and used in making lime; and it was stated, that the limestones were hydraulic; this fact is interesting, inasmuch as the lime would be wanted in constructing the brick or stone masonry of the culverts and abutments to the bridges.

For three miles east of the State line, and for fourteen miles west to Silver lake, west of Angola, the surface of the country becomes more rolling and tossed in abrupt hillocks and ridges of sand, coarse gravel, and in some instances gravel mixed with clay. This portion of the line is the most objectionable part of the route, if we except the division between Laporte and Michigan city; the profiles, however, show nothing except the steepness of the reversed grades, which forbids this location. I formed an opinion in passing this region, that a better route might be found towards the south, where the hillocks and high summits could in a great measure be avoided. This opinion was afterwards confirmed by Gen. Orr, who, at the time the surveys were made, reconnoitered, in company with one of the engineers, a more southerly line into the State of Ohio; and they came to the conclusion, that an improvement could be made; and a survey was accordingly commenced, and prosecuted until the party became disabled by sickness.

The gravelly character of the soil in the vicinity of the adopted line, insures, within a reasonable expense, a roadbed of the greatest durability, even if the clay is met with in the deep cuttings, for the gravel which forms the surface of the country here, could easily be used to supply the place of the clay when removed for the roadbed, as it always should be, for a breadth of about 8 feet, and for a depth of  $1\frac{1}{2}$  to  $2\frac{1}{2}$  feet under arch track.

The character of the country west of Silver lake, to the town of Elkhart, following the northern route, via Lima and Bristol; is unexceptionable for a railroad, both in respect to the quality of the soil, and evenness of surface, as exhibited by the profile. I think the clay would not be found in this division of the route; for its presence has not been noted on the profile where the soil is described as sandy, gravelly loam or marsh.

The profile of the rival line through Goshen, shows a different condition of things, in the series of summits and steep reversed grades which occur, in place of the gradual descending grades and evenness of the northern line. The difference of distance between the two routes, from their divergence near

Union Mills, to their junction at Elkhart village, is stated in the report of Mr. Hardenberg, dated December, 1837, to be 228 miles. I was informed by individuals who were interested in the Goshen route, that it was anticipated a better route east from Goshen to the Ohio line, could be found in a course south of all the lines hitherto explored. The soil on the Goshen route is represented on the profile as consisting chiefly of gravel and loam with some marsh and wet soil.

From Elkhart to South Bend, the line follows the left bank of the St. Joseph, and the grades, which are light, except three, correspond to the surface of the country; and the cost of grading consequently light; at two places only, at Baubaugau river, and at a mill stream, would any extra work, above the minimum cost of construction, be required. The soil is supposed to be sand, gravel or loam at the surface, but perhaps clay would be found if the excavations were deep—as it is found in places in the banks of the St. Joseph, where clay for the straw colored bricks of the country is sometimes taken.

The route from South Bend to Laporte, passes down the southeast side of the Great Kankakee marsh, alternately crossing points of upland and marshy cover, until at about 14 miles from South Bend, it takes a new course across the marsh and Kankakee river, in a direction towards the town of Laporte; and after crossing the inlet to Fish lake and the Little Kankakee, the line, at about six miles short of its termination, enters and follows for the remainder of the distance, the Great Laporte prairie. This course is circuitous, and should, if possible, be avoided; I was informed that a more direct route to Laporte had been explored, and in part surveyed; and abandoned on account of the rolling character of the intervening country. The marsh if deep should be avoided, even at considerable cost of construction, and increase of grades; that is, supposing piles would be required for the support of the superstructure; besides the probability is, that where the line passes over a rolling country, a better material would be found for the roadbed, unless the formation was clay. The line surveyed, is probably three miles longer, than a straight line drawn between its two extremities.

From Laporte to Michigan city, the line for nearly the whole distance has been cleared of the timber, and considerable work done in grading the road. The profile shows the surface of the country for about 8 miles out of 13-20, (the length of the division) to be undulating, and after passing the summit, 5½ miles northwest from Laporte, descends precipitously for  $2\frac{1}{2}$  miles, at rates varying from 63 to 75 feet per mile. There occurs also, at about 4 miles from Michigan city, an ascending grade of 58 feet per mile, which should be reduced to 40 or 45 feet per mile. The worst features of this division are its grades; the cuttings and embankments, although considerable for two-thirds of the distance are not extraordinary.

It is apparent that the objections to the line as located, cannot be obviated without considerable increase of cost, distance, or sacrifice

of great interests, both by the company who shall undertake its construction, and the citizens of this populous district. This division is longer than a straight line drawn between the termini of about  $1\frac{1}{4}$  miles.

From Michigan city to the Indiana and Illinois line, following the surveyed south route the surface of the country on the line is extraordinarily level and smooth for so great a distance as 35 miles; it is rare to see so fine a profile; and the soil for a greater part of the distance must be good for a roadbed, if we can form an opinion from the character of the common roads in the vicinity, which are seldom if ever in a muddy state. At Deep creek and Calumet river, some deep marsh is noted on the profiles; the length of these patches, however, are limited; not exceeding twelve or fifteen hundred feet.

As it was the object, at the time this part of the route was explored, to enter the State of Illinois in the direction of the highest steamboat navigation of the Illinois river, intersecting the State line at a point 13 miles south of the northwest corner of Indiana, where the boundary line terminates at lake Michigan; it is probable that this idea of entering the State of Illinois so far south will be abandoned, provided a practicable route is found nearer the lake in the direction to Chicago, such a line was explored by Gen. Orr, and a survey commenced by Mr. Farnum the engineer, at the northwest corner of Indiana, and prosecuted until his party on account of sickness, had to abandon the survey after some progress had been made, and on account of professional duties more urgent, Mr. Farnum never resumed the survey.

The following is Mr. Farnum's description of the lake route:

"After completing the preceding surveys, I proceeded north to lake Michigan and commenced another at the State line, in order to determine the practicability of a shorter route in the direction of Chicago and Galena.

"This was commenced in towns 38 north range 10 west, and runs in a southeasterly direction, parallel, and within two or three hundred feet of the lake, for  $4\frac{1}{2}$  miles, when it passes on to a very small sand ridge, which it follows nearly to the Calumet river.

"In the vicinity of the lake for many miles sand ridges of various widths and elevations are very numerous and appear to have been formed by the subsiding of its waters. They commence at the lake and terminate at the Grand Calumet river, separated by sloughs and pools, of various widths and depths.

"The ridge, upon which the line passes, is elevated from 5 to 12 feet above the lake, and its width varies from thirty to three hundred feet.

"I have also made an examination of that part of the route, which was not instrumentally surveyed, and am prepared to express it as my opinion that no obstacles exist, but what may be removed at a limited expense.

"This line will cross the Grand Calumet in range 8 west, township 37 north, section 32 or 33, and pass about one mile south of Indiana city, and will connect with the for-

mer line east of the Little Calumet river and west of City West.

"By adopting this route, the line through the State will be increased three or four miles and the distance to Chicago lessened about seven miles."

The line of Mr. Farnum described above is the one that will be adopted if found practicable, I have no doubt. There is, in my opinion, but one difficulty that may arise on this route, if it becomes necessary to locate the road through or very near the sand hills which skirt the lake from Michigan city to and beyond the State line. It may happen that the road in the excavations and even on the embankments, may be buried by the drifting sand. To avoid this, some engineering skill may be required, and tunnelling in some one or two instances may become expedient, to save heavy annual expense in clearing the tracks.

In the estimates, I have assumed the cost of the road on this route, the data being imperfect; having seen but a small portion of the eastern part, where it entered some of the sand hills most distant from the lake; and where the difficulties were represented to be the greatest.

The Illinois division of the line has not to my knowledge, been surveyed, either from the terminus of the south or lake route; but from what was apparent along the stage road which I passed over on my reconnaissance, my opinion was decided, that nothing whatever existed to prevent the extension of the northern or lake route to Chicago, at minimum cost of construction; the country being generally low and level, and free from water courses. The line would lie along the lake shore where the washed pebbles of the beach could easily be procured if desired, for forming a most solid and durable roadbed.

At Chicago, I ascertained from the recent government survey, made by Mr. McLellan, of the topographical engineers, that the distance on a straight line across the lake, from Chicago pier to the pier of Michigan city, was 39 miles, and the distance between the same points, following the beach was  $47\frac{1}{2}$  miles. By the aid of the railroad surveys, and other plans obtained at the west, I make the distance from Michigan city to Chicago, by the lake route, to be 50 miles.

In composing the estimate for the superstructure, I have had in view two rails of different weights, one of 80 lbs. and one of 56 lbs. the lineal yard, for the purpose of exhibiting the cost of the road laid with each rail in comparison. The item of superintendence, engineering and contingencies, has been put down at about the same sum in each case; considering the simple increase of weight, in the article of rails, would have but little influence in increasing the contingencies, superintendence or engineering.

On inquiry here, I find some of the railroad companies have recently contracted in England for the heavy T rail, at the price of £12 per ton, delivered in England; but by the last quotations, the price was reduced to about £10 10s. per ton; which latter price I have adopted in the estimates. The heavy T rail

is now made in this country, from iron of excellent quality, and good workmanship, for \$85 per ton; which is higher than the English rail delivered in this country, duties paid.

It will be seen that I have omitted the item of subsills in the estimates, contrary to the usual practice; their use has been discontinued on the Boston and Worcester railroad, where they are considered worse than useless—their presence increasing the cost of repairs. In cases where the soil was soft and retentive of moisture, the number of cross sleepers should be increased. I have supposed in the estimate, 7 sleepers to each length of rail, and it would be better to increase them to 8 where the rail exceeds 16 feet. By using a heavy rail and multiplying the sleepers, we increase greatly the bearing surface on the roadbed; which if made of good gravel or dry sand, would not yield to the pressure more than they would if buried one or two feet in the soil, where the water would collect and remain for a long time, to the injury of the road.

#### DETAILED ESTIMATES.

##### No. 1. Cost of superstructure for one mile of single track.—Rail 80 lbs. to the yard.—For the Ohio division of the line.

T rail 80 lbs to the yard, delivered at Toledo, 140-80 tons, at \$93 50.....	\$13,164 80
2310 white oak sleepers, 7 to the length of each rail of 16 feet, at 15 cts.....	346 50
650 clasp cast iron chairs, each 20 pounds—13,200 lbs., at 3 cts.....	396 00
4950 lbs. spikes, at 6 cts.....	297 00
825 lbs. bolts for chairs, at 6 cts.....	49 50
Transporting rails, chairs, etc., from Toledo to the average distance in the State of Ohio.....	150 28
Labor, laying down superstructure, including fitting chairs to the rails.....	395 92

Total cost of one mile superstructure laid in Ohio.....\$14,800 00

##### No. 2. Same rail (80 lbs. to the yard) laid in Indiana, would require an additional cost of transportation to the average distance in that State, of \$500; making the total cost of one mile of road.....\$15,300 00

##### No. 3. Same rail (80 lbs. to the yard) laid in Illinois, adding additional cost of transportation, would cost for each mile of road.....\$15,600 00

##### No. 4. Cost of superstructure for one mile of single track.—Rail 56 lbs. to the yard.—For the Ohio division of the line.

T rail 56 lbs to the yard, delivered at Toledo, 98-56 tons at \$93 50.....	\$9,215 36
11,733 lbs. clasp chairs, at 3 cts.....	351 99
2,053 sleepers, 7 to the length of each rail of 18 feet, at 15 cts.....	307 95
8,212 lbs. spikes and bolts, at 6 cts.....	492 72
Transporting rails, chairs, etc., from Toledo to the average distance in the State of Ohio.....	108 52
Labor, laying down superstructure, including fitting chairs to the rails.....	423 46

Total cost of one mile superstructure laid in Ohio.....\$10,900 00

##### No. 5. Same rail (56 lbs. to the yard) laid in Indiana, adding the additional cost of transportation, would cost for each mile of road.....\$11,300 00

##### No. 6. Same rail (56 lbs. to the yard) laid in Illinois, adding the additional cost of transportation, would cost for each mile of road.....\$11,500 00

In the estimates which follow, I have been under the necessity of using the quantities of

earth work given in the reports of Messrs. Hopkins, Hardenberg & Farnum, and affixing to them new prices, to accord with the great change time has produced along the whole line, in creating greater facilities for doing work of all kinds.

From particular inquiries made of people who had executed earth work at the east as well as the west, I have reason to believe that the prices now adopted will make the road, even supposing much of the road bed will have to be removed, and replaced by a better material brought from a distance.

The width of the road, at grade line, in Indiana, is stated in the engineer's reports to be for a double track; in Ohio, Mr. Hopkins has not stated clearly whether the earth work was computed for a double or single track; his remark at page 11, where he states, "It will be seen that I have estimated for a single track only," refers I suppose to the superstructure of the road.

The masonry for the culverts and bridges has been computed anew from the profiles, and the prices adopted are for brick work laid in hydraulic cement. The absence of stone on nearly the whole route through Ohio and Indiana, and the probability of obtaining brick at a very cheap rate in both States, has induced me to propose this material for the masonry.

The wood work for the bridges has also been estimated anew from the spans given or inferred, from the plans, profiles and reports.

**ESTIMATE.**

*First division of 15 miles in Ohio, commencing at Toledo.*

Cost of single track laid with  
80 lb. rail. 56 lb. rail.

13,500 cubic yds. excavation, at 10 cts.....	\$1,350
22,400 do., at 14 cts.....	3,136
32,000 do. embankment at 11c.....	3,520
39,000 do. do., at 18 cts.....	7,020
Canal and other bridges.....	5,500
Piling in marshes.....	2,000
Clearing and grubbing, chiefly oak openings.....	750
Land and damages, 180 acres, at \$3.....	540
Superstructure as per detailed estimate No. 1, 15 miles, at \$14,800.....	222,000
Superintendence, engineering and contingencies.....	20,184
15 miles of road at \$17,733 33.....	\$266,000
<i>Same division laid with 56 lb. rail.</i>	
Grading the road as above, exclusive of superstructure, superintendence, engineer- ing and contingencies.....	23,816
Superstructure, per detailed estimate No. 4, 15 miles at \$10,900.....	163,500
Superintendence, engineering and contingencies.....	13,684
15 miles of road at \$13,733 33.....	\$206,000
<i>Second division of 15 miles in Ohio at \$17,066 66.....</i>	
Same division laid with 56 lbs. rail, at \$13,200.....	198,000
<i>Third division of 15 miles in Ohio, at \$18,000.....</i>	
Same division laid with 56 lbs. rail, at \$15,200.....	213,000
<i>Fourth division of 21-213 miles in Ohio to the Indiana line, at \$18- 39:39.....</i>	
Same division laid with 56 lbs. rail, at \$14,438 87.....	209,000

Cost of road laid with 80 lbs. rail thro' Ohio, 66-31 miles, at 17,855 51 per mile.....	1,184,000
Cost of road laid with 56 lbs. rail thro' Ohio, 66-31 miles, at \$13,964 71 per mile.....	926,000
Fifth division of 25-26 miles in In- diana, from Ohio line to Union Mills, at \$20,427 63.....	516,000
Same division laid with 56 lbs. rail, at \$16,349 96.....	413,000
Sixth division 39-09 miles in Indiana —from Union Mills, via Lima & Bristol, to Elkhart—north route, at \$18,930 67.....	740,000
Same division laid with 56 lbs. rail, at \$14,811 98.....	579,000
Sixth division, 41-31 miles, in Indi- ana, from Union Mills, via Gosh- en to Elkhart, south route at \$19- 458 55.....	805,000
Same division laid with 56 lbs. rail, at \$15,349 29.....	635,000
Seventh division, 15-56 miles, in In- diana, from Elkhart to South Bend at \$18,830 34.....	293,000
Same division laid with 56 lbs. rail, at \$14,717 23.....	229,000
Eighth division, 27-17 miles, in Indi- ana, from South Bend to Laporte, at \$19,286 98.....	524,000
Same division laid with 56 lbs. rail, at \$15,163 78.....	413,000
Ninth division, 13-20 miles, in Indi- ana, from Laporte to Michigan city, at \$22,727 27.....	300,000
Same division laid with 56 lbs. rail, at \$19,393 94.....	256,000
Tenth division, 35-13 miles, in Indi- ana, from Michigan city to Illi- nois line, south route, at \$17,677 20.....	651,000
Same division laid with 56 lbs. rail, at \$13,578 14.....	477,000
Tenth division, 37 miles in Indiana, from Michigan city to Illinois line, north or lake route, at \$18,648 65.....	690,000
Same division laid with 56 lbs. rail, at \$14,540 54.....	538,000
Cost of road laid with 80 lbs. rail through Ohio and Indiana, 223-59 miles, at \$18,984 59 per mile.....	4,247,000
Do., with a 56 lbs rail, at \$14,996 20 per mile.....	3,353,000
Eleventh division, 13 miles, in Illi- nois, from north corner of India- na to Chicago—continuation of lake route—at \$18,230 77.....	237,000
Same division laid with 56 lbs. rail, at \$14,076 94.....	183,000
Total cost of road laid with 80 lbs. rail, from Toledo to Chicago, 236- 59 miles, at \$18,952 62.....	4,484,000
Do. with 56 lbs. rail, at \$14,945 69.....	3,536,000
<i>Depots, Side Tracks, Tools, etc.</i>	
Cost of depot at Toledo, including all the necessary shops, side tracks, etc.....	60,000
Side tracks, watering stations and depots, within the State of Ohio, using the 56 lbs. rail.....	34,000
Side tracks, watering stations, depots, including 6-10ths of a mile of branch road, at Michigan city, using the 56 lbs. rail.....	115,000
Side tracks and watering sta- tion in Illinois.....	3,000
Depot at Chicago, including all the necessary shops, ware houses, etc.....	60,000
Total cost of road laid with 80 lbs. rail, including all fixtures and	272,000

tools, but exclusive of the motive  
power, 236-59 miles at \$20,102 29, 4,756,600  
Do. with 56 lbs. rail at \$16,095 35.. 3,808,000

<i>Motive Power.</i>	
36 locomotives, \$7,000.....	252,000
12 first class passenger cars, each containing 64 seats, at \$1,900.....	22,800
8 second class, containing 64 seats, at 1,200.....	9,600
8 baggage cars, at 400 dolls.....	3,200
120 long box freight cars, at 780 dollars.....	93,600
100 short do., at 400 dollars.....	40,000
30 long platform freight cars, at 550 dollars.....	16,500
30 short do., at 340 dollars.....	10,200
50 gravel cars, at 200 dollars.....	10,000
24 hand cars.....	1,100
	459,000

Total cost of the railroad from To-  
ledo to Chicago, furnished with a  
motive power equal to four thro'  
passenger, and four through bag-  
gage trains, each day; being at  
the rate of 23,042 35 dollars per  
miles for the 80 lbs. rail.....5,215,000  
And 18,035 42 dollars per mile for  
the 56 lbs. rail.....4,267,000

To be Continued.

**Baltimore and Ohio Railroad.**

*Twenty-first Annual Report.*

Continued from page 604.

**THIRD—OF THE FURTHER PROSECUTION OF THE  
ROAD TO THE OHIO RIVER.**

Under this head the Board are gratified to be enabled to congratulate the stockholders that by their action on a recent occasion, one of the obstacles that has hitherto retarded the extension of the road to its ultimate destination, has been removed.

By an act of the Legislature of the State of Virginia, passed at the last session, the grant of the right of way through that State has been renewed for a period of twelve years, upon the condition that the road shall be extended to the city of Wheeling without touching the Ohio river at a point lower down the mouth of Fish Creek, 28 miles below Wheeling.

With the consent of the City of Wheeling the Company is authorized by the law to establish a Depot at the mouth of Fish Creek; and Wheeling having in due form given her consent for that purpose, the Company has the option, in extending the road, to construct it to the Ohio at that point.

The Board are not aware that until very recently there has ever existed any diversity of opinion with the proper authorities, or in the community at large, of the expediency of extending their road to a southern point on the Ohio, from which they could with the least competition command the trade and travel passing up the river, and most certainly form connections with the improvements of Ohio, upon both the central and southern lines on which they have been projected in that State. And the Board do not doubt that it is the clear, unquestionable policy of the Stockholders of the State, and especially of this city, by the extension of their road to a southern point on the river, to attract the western improvements from any other point to which they might possibly be diverted, and at which they would be brought within the attraction of the rival cities north of Baltimore. A connection with the western

roads in the State of Ohio, upon either the central or southern line, in that state, would be indispensable to the success of this enterprise, and its ultimate object would be most effectually obtained by extending it so as to connect with both, and without the risk of competition with the northern rivals. In the earlier history of the Company, greater reliance than at present was placed upon the river trade and travel, and the city of *Wheeling* was considered by the projectors of the road as not only commanding these, but at the same time insuring a connection with the Railroads on the central line of the Ohio improvements. In all the applications of the Company for the right of way through the State of Virginia since the year 1842, however, the Company have asked for the option of extending their road to any point on the Ohio within that State they might select above the mouth of the little Kanawha, intending undoubtedly to terminate it at some point within that range of choice. Within those limits the selection must have been, and was expected to be, regulated so as to ensure a connection with the Ohio improvements, both on the central and southern lines; and it would have been necessary to avoid a terminus so far south as might force the improvements on the central line to a more northern point on the river, beyond the reach of this road. It had been, until recently, supposed that the mouth of *Fishing Creek*, twelve miles below *Fish Creek*, presented the best medium point for both purposes; and the impression generally prevailed that while the improvements on the southern line in Ohio could certainly connect more advantageously at *Fishing Creek*, those on the central line could also be more easily formed at the same point, than at *Wheeling*. From subsequent information, however, it would appear that the central improvements in Ohio may connect with this road on the river as advantageously at *Wheeling* or *Fish Creek*, as at *Fishing Creek*; and the former being only twelve miles farther from Cincinnati on the southern line than the latter, it is not to be supposed that so small an elongation in the distance, would interpose any obstacle to the prosecution of the works projected on that line.

The distance from Cincinnati to Baltimore on the Southern line through Ohio, by the mouth of *Fishing Creek*, may be stated at 600 miles, and to New York 800 miles, and to Baltimore, by the way of *Fish Creek*, 617 miles, and to New York, by the same point, 817 miles. While, therefore, from Cincinnati to New York, by the way of *Fishing Creek*, the distance would be 109 miles less through Baltimore than by the Northern route projected to New York, the distance to New York by way of *Fish Creek* would be still 92 miles nearer through Baltimore than by the Northern route.

In this view of the subject, and deeming it inexpedient to hazard the extension of their work upon the future legislation of Virginia, the Board thought the prosecution of the road to *Wheeling* by the mouth of *Fish Creek* would insure effectually a connection

with the Ohio works, on both the lines projected in that state, and still enable them to maintain a successful competition with New York.

They do not consider that the projectors of either of the lines in the State of Ohio, should expect to exclude the other from a connexion with this enterprise at a point most acceptable to it; and in the arrangement this Company have made with the city of *Wheeling*, and by accepting the Virginia law subject to its provisions, it must be conceded that the Board and the Stockholders have made a better compromise and accomplished more for those interested in the Southern line of improvement, than the same parties have been able to effect in any other way. It is to be observed moreover that the cost of the work to *Fish Creek* will not be greater than to *Fishing Creek*; and as the construction of the road from the former point to *Wheeling* will be made by the contribution of that city, and the depot and the right of way through the city being provided at the expense of that city, the Company will not have less ability to execute their engagements with the city of *Wheeling*, than if they had succeeded in their object of terminating the road at *Fishing Creek*.

It may be assumed, therefore, that in accepting the Virginia law, and confirming the agreement with the city of *Wheeling* the Stockholders have not only consulted the interests of the several companies engaged in making the improvements on the southern and central lines of Ohio, and ensured the connection of both with their road; but have acquired the right of reaching the Ohio at the point originally contemplated by the state and the city, with the additional and important privilege of extending it 28 miles lower down the river than they originally desired to do or could have done at any time since the spring of 1838. They may thus be enabled to accomplish their original object without the necessity of constructing a rival branch to their main stem, thereby attracting the travel and trade to a rival city; while by encouraging a connection of their road with the improvements on the southern line in Ohio, they offer new inducements to the works on the central line to form a similar connection, in preference to longer and more expensive lines to any Northern point.

Looking to these objects, it will now be in the power of the Company, by a vigorous and energetic prosecution of their road in conformity with the law and the agreement with the city of *Wheeling*, speedily to realize all that ever has been hoped from the enterprise.

It is not to be concealed, however, that for the accomplishment of this object, the united and cordial co-operation of those interested in the prosperity of the Company and of the city, will be needed; and the Board will not doubt that it will be effectively afforded. For twenty years the Stockholders, under the auspices of the state and the city, have been exerting all the means at their command to extend the main stem of the road to a point on the Ohio not farther north than *Wheeling*,

and in 1835, the state and the city proposed a liberal amount of aid to effect that object. The universal depression in the public credit which soon followed those efforts, and the expiration of the time limited in the acts of Virginia and Pennsylvania temporarily defeated the purpose. For the last ten years no exertion has been spared to obtain a renewal of the right of the way, within the limits of the original Virginia grant. These exertions have finally resulted in a choice of routes less restricted than that accepted in 1838, and not only in confirming the terminus deliberately and definitively adopted in that year, but in enlarging the route, so as to embrace a more Southern point, accessible to connections which might not have been commanded from *Wheeling*. For the accomplishment of this enlarged and more comprehensive object, there will be less distance, and fewer difficulties to overcome, and a less amount of capital to be employed than would have been necessary if the work had been extended under the laws in force from 1838 to 1843; and it is not to be presumed that having succeeded to an extent so much beyond their early hopes and expectations, any of those who have heretofore deemed the completion of the enterprise so essential to the prosperity of Baltimore, will abate any of their zeal and energy. The Board would have greatly mistaken the objects and purport of the trust confided to them, if, succeeding in their efforts, after so much toil and so many discouragements, they were not cordially supported in the prosecution of their work; and the Stockholders, if they neglected or failed in the necessary energy to use the opportunity they have deliberately sanctioned, would, in all reasonable probability, forever prevent the extension of the road to any point west of Cumberland. There is no occasion, and the Board have no disposition to arraign opinions which, amid the uncertainty and discouragement of obtaining the right of a terminus at a southern point, may have grown up in any quarter, favorable to a different and more northern line. So far as such opinions may have sincerely desired an early prosecution of the road to the western waters, and, from an apprehension that, either from the want of authority or of adequate means, the best would not be accessible to the Company, on these grounds advocated the adoption of an inferior line, rather than not go forward, they may be entitled to respect.

Opinions of this description, however, have no longer any reasonable pretext for their maintenance, more especially if an unreasonable persistence in them would most probably entail upon the community even greater mischief than they professed to avert. It is impossible that the subject could have been more thoroughly investigated, or more maturely considered by all that could be expected to take an interest in it. In the various and elaborate discussions to which, through a period of ten years, it has given rise in the Legislature of a sister State, and in the mass of facts and information developed in the course of an intelligent and free examination

of its merits in this community, every thing that could assist the mind in forming a sound conclusion has been elicited. The Board are not at liberty to suppose that those who have been called to pronounce their final judgment upon a subject of so much importance, and so deeply involving public and general interests, could be guided by any other consideration than those identified with the successful prosecution of their enterprise, and with the trade and commercial prosperity of this city; and to say that those by whom the ultimate decision was made, thoroughly knew and comprehended the advantages on one side and the hazards upon the other, and perhaps more than any others would seriously suffer from a mistaken course, would only be to say what would be felt and acknowledged by all.

The present enterprise in charge of the Stockholders may emphatically be said to be essentially a work upon which the prosperity of Baltimore is dependent. It has already absorbed three millions of capital of individuals interested in the prosperity of the city, and three and a half millions of that of the Corporate authorities, to be justified only by such an extension of the Road as would increase the trade and augment the value of every species of property; and it must not be overlooked that, of the assessment, in any form whatever, that may be necessary to refund to the State the unusual interest upon her loan to the Company, a full moiety, at least, must be borne by the authorities and people of Baltimore. In such a case, therefore, whatever diversity of opinion might at any time have prevailed in quarters and upon grounds already alluded to, it would be only reasonable and just towards all the great interests involved, after a final decision of the subject by so large a majority, that all interests would unite in rendering the decision effectual.

It is a great misfortune that ten years have already been spent in seeking the right to extend the road to the Ohio; but if, after obtaining it, upon terms satisfactory to a large proportion of those principally and substantially interested, ten years more are to be wasted in controversies respecting a route, or in excited struggles to reverse the decision already made, it would not only add to the misfortune of the past,—it would be in every view of the subject fatal. In the present condition and progress of improvements in other States, a stationary policy upon the part of this community could not be otherwise than fatal to their prosperity. If they do not now make an effort to extend their great work to the Ohio, other States will soon complete their exertions to attract the trade and travel of the West into other channels, and to cities of greater capital and other advantages, from which we will not be likely at any future day to divert them. That all the advantages, and any amount of trade that could ever have been anticipated from the extension of the road to the Ohio, may be commanded, and at no greater cost, by the route, and at the point selected by the Stockholders, has not been, and cannot be denied; and if any at-

tempt to embarrass that selection, by active opposition or a withdrawal of support; by ultimate defeat or unreasonable delay, can end in any thing short of a total destruction of all the great objects of the enterprise, the Board have not been able to conjecture it. For an object of such magnitude, therefore, appealing to so many interests, promising so many advantages, which, in fact, is so necessary to the commercial prosperity of Baltimore, and to the development of such an important region of the State that could not be developed by any other line of roads, the Board must continue to rely upon the cordial co-operation of all those interests which it has been their constant aim to promote.

Thoroughly impressed with a sense of their own duty in this posture of their affairs, the Board are prepared to exert their utmost resources and energies to press forward their work in good faith, in conformity with the authority now conferred upon them, and pursuant to the arrangement with the city of Wheeling. Their first duty, and the first measure devolved upon them, will be by minute instrumental surveys to discover and adopt the cheapest and best line, and to obtain the right of way, and establish the location preparatory to the requisite contracts. Several parties of Engineers are now in the field, and it is hoped that the surveys, on the preferred route through this State, to the Virginia line, may be completed during the present year. It would undoubtedly be the duty, and is the wish of the Board to extend the road from the city of Cumberland through this state, rather than confine it as they may do—entirely to the State of Virginia. It has already been hinted that the extension of the road upon the line through Maryland would immediately develop the coal and iron-deposits near the Potomac, and the important agricultural resources of the Glades, which would be wholly neglected by a line through Virginia, or even through another part of this state in pursuit of a more northern terminus. On this ground as well as to accelerate the completion of the surveys and the progress of the work, the route through Maryland ought to be preferred. If, however, from any sufficient cause whatever, the board should be called to leave the State of Maryland, and confine their route to the State of Virginia, their operations would only be retarded. In any event they will indulge the hope of being able to complete the surveys, and final arrangement for the right of way, so as to locate the line and place it under contract in the course of the next season.

It will be the duty of the board to employ the interval in devising the means, and effecting their financial arrangements to prosecute the work with the least possible delay; and although they deem it premature at this time and in this place, to advert in detail to the various sources and modes of arrangement from which they expect to obtain the means of prosecuting and finishing the road, they have reason to hope that the measures they have in contemplation for those objects will not be unsuccessful. They indulge only a reasonable confidence, moreover, in believing

that they will have at their command available and important resources which may be applied to the prosecution of the road authorized by the Virginia law, and the arrangement with Wheeling, that could not, by possibility, be commanded in aid of a road to a more northern point on the Ohio; and they cherish the hope that the temptation they will be enabled to offer to capital, and the just appeal they may make to all the great interests involved in the accomplishment of the work, will not be made in vain.

In conclusion, the board can only promise the faithful and energetic performance of so much of the duty appertaining to the prosecution of the work as is devolved upon them. If, after this, the enterprise be destined to failure, the board, at least, will stand acquitted.

In connection with this subject, and in further explanation of the recent law of Virginia and the agreement with the city of Wheeling, as well as for the purpose of bringing together the present state of the company's affairs, and the general grounds upon which the stockholders may be supposed to have made their recent decision, the board have deemed it expedient to append to this report, the report and documents accompanying it, of the committee by whom the arrangement with the city of Wheeling was concluded.

By order of the board.

LOUIS MC LANE, President.

October 1st, 1847.

#### Nashville and Chattanooga Railroad.

The following extract from the late message of the governor of Tennessee to the legislature, now in session, is in the right spirit. It speaks of the importance of the extension of this road, and the completion of the Hiwassee road, and earnestly recommends the subject to the attention of the legislature. He speaks also of the improvement of the Cumberland river and several other water courses, and anticipates, very justly we think, a state of prosperity for Middle Tennessee, when these works shall have been completed, equal to almost any other part of the Union.

If the legislature will now do as well as the councils of Nashville have done—and aid the railroad company to the amount of a million of dollars—the people of Middle Tennessee may easily take a saltwater bath at Savannah, or Charleston twice a week the year round.

"The completion of the Georgia railroad to Chattanooga, an event now soon to be expected, will constitute a new and important era in the commercial and agricultural history of the eastern portion of our State. It unlocks the door which for many years has been closed against the profitable exchange of her mineral and agricultural productions with the other States which surround her.—If nothing more were done, her people might well exult in such a vast improvement in their condition. But the Hiwassee railroad, extending as it will the benefits of this improvement to a much higher point on the Tennessee, at Knoxville, makes the completion of the whole line a matter of intense and almost vital interest to the whole of that large and interesting portion of the State. We have now good reason to expect the completion of

this latter portion of the road. The company has been reorganized, its old liabilities have been, to a considerable extent, discharged, and the present excellent directors have exhibited a laudable determination to push forward the work with vigor and earnestness.

"From Knoxville, if a well built macadamized road, extending in the proper direction to the Virginia line, could be constructed, and the principal obstructions in the Tennessee river could be removed to the flourishing village of Kingsport, East Tennessee, reposing amid her lofty mountains, would be surpassed by no portion of our State in the abundant means of wealth and general prosperity.

"If these grand projects cannot be carried on successfully by individual capital and enterprise, it will devolve upon you to determine whether any and how much assistance can be furnished by the State. The objects are of sufficient importance to engage in their behalf as full a share of State encouragement as her present liabilities and means would render prudent, and to this extent I earnestly recommend the subject to your attention.

"In Middle Tennessee we are every day receiving the richest rewards from many of the improvements already made. The eye strikes at once on the map and traces out the many great roads stretching across the State, and centring at Nashville, a convenient point of the navigation of the Cumberland. So too it glances along another road striking from Columbia, situated in the very heart of this middle region, and terminating on the Tennessee in its northern sweep through the State. Further north is to be seen a fine road coming in from Kentucky, terminating at Clarksville, and destined to contribute largely to the prosperity of a beautiful town now rapidly improving and bidding fair to become one of the most important commercial places in the State. Still the most superficial observer cannot fail to perceive the immense advantages to be derived by an extension of the Georgia road from Chattanooga to Nashville—advantages not to Chattanooga or Nashville alone, nor to the counties through which it would pass, but to almost every county in the middle portion of the State. This truth is every day becoming more manifest, in the increased anxiety everywhere displayed in favor of its construction. The corporation of Nashville has been authorized by the popular vote of the city to subscribe for half a million of the stock, and many individuals of acknowledged sagacity and shrewdness in all that relates to the profitable investment of their funds are known of, who intend to embark freely in the enterprise. In connection, however, with this work, the improvement of the Cumberland ought not to be lost sight of. A charter to individuals for this purpose was granted at the last session of the general assembly singularly defective in some of its provisions. I earnestly recommend its supervision and amendment in such a manner as to ensure the speedy removal of these obstructions, so detrimental to the commerce and trade of the middle portion of the State.

When the Chattanooga and Nashville railroad shall have been completed, and the obstructions in the Cumberland, the Elk, the Duck and the Kaney Fork, shall have been removed, it would be difficult to find any other region in the world possessing more advantages than Middle Tennessee. With a soil remarkable for its fertility—a climate happily exempt from the sickness of the south and the intense protracted cold of the north—a population proverbial for its industry, sobriety, and enterprise—with an easy accessibility by her roads and rivers to the markets of New Orleans, and through her proposed railroads to those of Charleston and Savannah, she may well challenge comparison with the most favored regions of the Union."

#### TRIAL OF THE DEE BRIDGE GIRDER.

Our correspondent writes from Chester, that the officers of the Chester and Hollyhead railway company, instead of waiting the inspection and test of a government commission, and entertaining, it is presumed, doubts upon the strength of the fellow to the broken girder, have tested it themselves on the very eve of the appointment of that commission. It was accomplished with railway bars, suspended from the girder; and the weight was gradually applied, and equally distributed over the centre division of the rib, until it reached 38 tons 6 cwt. 2 qrs. 18 lbs., under which it broke. The fracture commenced at the bottom flanges, and proved clearly that it broke by tension. This experiment at once shows the fallacy and utter uselessness of the tension bars in the manner in which they were applied at this bridge. In addition to the bungling at the Dee bridge, which 'bangs Banagher,' they are now taking down the girder bridge over the Chester and Ellsmere canals of 60 feet span, in consequence of some fractures being observed in the masonry at the quoins of the abutment upon which outside girders rest.—*The Builder*.

#### IRON FOUNDRY OF SERAING.

This immense establishment—the most important in Belgium—was founded by the late John Cockerill, but has since been very greatly extended by its present proprietor, M. Pastor. It now occupies a superficial extent of 2170 yards, has six blast furnaces, five of which are employed in smelting, and the remaining one in preparing the metal for superior castings; the produce of the five is about 62½ tons of pig iron in 24 hours, and the latter one 9 tons of fine casting metal in the same period. The quantity of material required to supply the furnaces, in 12 months, is 53,572 tons of iron ore, 34,822 tons of coke, and 14,723 tons of limestone, or other flux; the tilt hammers weigh 4½ tons each; 11 steam engines are employed, of an aggregate power of 500 horses; the principal forge produces 85 tons of wrought iron monthly. The workshop, for the manufacture of locomotive engines, extends over a space of 1250 square yards, traversed down the centre by two parallel lines of railway; and the lathes for turning the various delicate parts are of the most gigantic description.—To form some idea of the extent of this es-

tablishment, the reader must bear in mind that there are upwards of 4200 men constantly employed day and night. In addition to the iron furnaces there are 14 smaller ones for copper, brass, steel, etc. The produce of the rough metal, before manufacture, cannot be much less than £1,000,000 sterling.

#### NEW RAILWAY SIGNAL.

Mr. Heinke, of Great Portland street, has invented a signal which merits the notice of all railway directors. The object is to afford a means of communication between the guard and the engine driver, nothing of the kind being at present in use, in the event of any unforeseen circumstance occurring, which requires the immediate stoppage or retardation of the train; the contrivance is simple enough, but is apparently none the less efficient on that account. Mr. Heinke proposes to have a wire or cord running over the top of each carriage, furnished with a spring swivel at the ends, permitting of instant attachment to its next neighbor, and consequently affording an extemporaneous connection between the extremities of the train. By this easily applied apparatus a spring bell, placed in the vicinity of the engine driver, can, in a moment, be struck by the guard, apprising the former of accident in the rear, the nature of which may be explained by any variety of signal blows that may be determined upon. No practical communication between the guard and the engine driver is at present adopted to provide for cases of sudden emergency, but Mr. Heinke has thus suggested a plan, which is not only susceptible of ready experiment, but which seems to be of a principle which cannot well fail; while its use involves the loss of no appreciable time, either in the process of adjusting, or in operation. The idea is capable of still further extension, inasmuch as a summons might in a case of necessity, be conveyed to the guard from the interior of any of the passenger carriages—experience having already proved an available correspondence with this functionary, to be among the desiderata of railway travelling. The model which has been submitted for inspection by Mr. Heinke plainly indicates that the advantages we have above described may be obtained, and obviously without much cost, though that is of small consideration.—*Mining Journal*.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

FULLER & BROWN, Agents,  
No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 104

**FOR SALE—300 TONS (10 MILES) FLAT** Bar Rail, in parcels or wholesale—section 2½ inches wide by 1 thick. The Rail has been several years in use, and its quality thoroughly tested—none but perfect bars delivered. Address

I. R. TRIMBLE,  
Wilmington, Del.  
**GILLESPIES' WORK ON ROAD MAKING.**  
A Manual of the Principles and Practice of Road making, comprising the Location, Construction and Improvement of Roads, (Common, Macadamized, Paved, etc.) and Rail Roads, by W. M. Gillespie, Professor of Civil Engineering in Union College. Published by A. S. BARNES & CO.,  
51 John St., New York.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

To all parts of the United States, North and South America, West Indies, India, [overland or otherwise,] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

**ROBERT GRACIE.**

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

4u

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**PATENT RAILROAD, SHIP AND BOAT Spikes.** The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by **JOHN A. ROEBLING, Civil Engineer,** Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

92v1 1v

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

**R. L. Stevens,** President Camden and Amboy Railroad Company; **Richard Peters,** Superintendent Georgia Railroad, Augusta, Ga.; **G. A. Nicolls,** Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; **W. E. Morris,** President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; **E. B. Dudley,** President W. and R. Railroad Company, Wilmington, N. C.; **Col. James Gadsden,** President S. C. and C. Railroad Company, Charleston, S. C.; **W. C. Walker,** Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; **R. S. Van Rensselaer,** Engineer and Sup't Hartford and New Haven Railroad; **W. R. M'Kee,** Sup't Lexington and Ohio Railroad, Lexington, Ky.; **T. L. Smith,** Sup't New Jersey Railroad Trans. Co.; **J. Elliott,** Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; **J. O. Sterns,** Sup't Elizabethtown and Somerville Railroad; **R. R. Cuyler,** President Central Railroad Company, Savannah, Ga.; **J. D. Gray,** Sup't Macon Railroad, Macon, Ga.; **J. H. Cleveland,** Sup't Southern Railroad, Monroe, Mich.; **M. F. Chittenden,** Sup't M. P. Central Railroad, Detroit, Mich.; **G. B. Fisk,** President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hineckly & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of **Erastus Corning & Co.,** Albany; **Hart & Merriut,** New York; **J. H. Whitney, do.;** **E. J. Eting,** Philadelphia; **Wm. E. Coffin & Co.** Boston. ja45

**MACHINE WORKS OF ROGERS, Ketchum & Grosvenor, Patterson, N. J.** The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

**Cotton, Wool and Flax Machinery** of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES' CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**  
Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331f

## LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address **J. M. HOWE,**

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philad e phia.

road Depots, etc.  
West Troy, May 12, 1847.

**ANDREW MENEELY.**  
1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**  
Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to **MURDOCK, LEAVITT & CO.,**

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper-barrels, by **JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its ability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	
11	4½	13 5	10	24 -		50	15-16	20
13	3½	9 3	8½	16 -		27	11-16	13½
14	3½	6 11	7½	12 8		17	9-16	10½
15	2½	5 2	6½	9 4		13½	1-3	7½
16	2½	4 3	6	8 6		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

Philadelphia, Pa. 1y35

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS, Reading, Pa. 1y45

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co. have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845. 1y19 Sup' Motive Power

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

445 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10 New York.

 New Jersey Malleable Iron Co., Newark N. J.  
 Gardiner, Harrison & Co. Newark, N. J.  
 25,000 to 30,000 made weekly. 35

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gear-work of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 30th 4 South Front St., Philadelphia. 25th

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

**IRVING VAN WART,**  
 12 Platt street, New York.  
**JOB CUTLER,** Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 28th

**S**PRING STEEL FOR LOCOMOTIVES, Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

**JOAN F. WINSLOW, Agent,**  
 Albany Iron and Nail Works,

**T**HE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

**REEVES, BUCK & CO.,**  
 Philadelphia.  
**ROBERT NICHOLS, Agent,**  
 No. 79 Water St., New York. 26th

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28th

J. BALL &amp; CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between these two roads, will run as follows, viz: Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1834 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, November 13, 1847.

**CHILLED RAILROAD WHEELS.**—THE undersigned are now prepared to manufacture their Improved Corrugated Car Wheels, or Wheels with any form of Spokes or Disks, by a new process which prevents all strain on the metal, such as is produced in all other chilled wheels, by the manner of casting and cooling. By this new method of manufacture, the hubs of all kinds of wheels may be made whole—that is, without dividing them into sections—thus rendering the expense of banding unnecessary; and the wheels subjected to this process will be much stronger than those of the same size and weight, when made in the ordinary way.

Willow St. below 13th,

Nov. 10, 1847. [if.] Philadelphia, Penna.

## Railway Accidents.

The increase of fatal accidents on railroads demands the attention of all who can contribute in any degree to their prevention. There has been, during the past few weeks, a succession of accidents on our railroads, attended with a frightful loss of life, unparalleled in our railway history; and we must come to the conclusion that there is a sort of fatality attending the operations on our railroads this season, or that there has been a sad lack of attention somewhere.

Without going beyond the month of October, we have the fall of a bridge on the road between Fitchburgh and Keene, with the loss of five or six lives—then another on the Reading road, where nearly as many more were killed—and now, within the past week, the sad accident on the Boston and Worcester road, where seven were killed outright, and others injured—and, as we understand, several per-

sons were killed on the Western road, at or near Pittsfield, one day this week. By these four accidents occurring within a month, nearly twenty lives have been lost—and probably half that number of families have been deprived of their main support. This is a sad state of things to reflect upon, especially if a want of proper care has in any way contributed to it; and therefore we feel constrained to refer to it, and to call upon the proper persons to investigate the matter, and to place the responsibility on the right shoulders—and also to endeavor to devise a remedy, if possible, for the evil.

## Schuylkill Coal Trade.

PHILADELPHIA AND READING RAILROAD.—Amount of coal transported during the week ending Thursday, November 4, 1847.

	Tons, cwt.
From Port Carbon.....	9,364 04
" Pottsville.....	4,982 18
" Schuylkill Haven.....	12,530 11

## Air Springs and Railway Buffers.

The Mining Journal of 27th October says: "Our attention has been directed to a new and valuable improvement connected with railroad travelling, exhibited at the Fair at Castle Garden. It appears to be a very simple and perfect machine, holding a given quantity of compressed air, which can be increased or lessened in a moment to suit any required pressure—easily attached to old or new trucks, and requiring no attention or expense to keep them in order. We see no reason why they should not entirely supersede every other kind of spring, as the saving of wear and tear equally to passengers, cars and roads, must be very important, and if attached to locomotives, will enable them to attain greater speed with equal safety. We have recently been on

the Somerville road, in a new and elegant car which has these springs under it, and the motion is very pleasing. Gentlemen who have rode in cars, in N. England, under which they are placed, assure us that the difference between them and the ordinary springs is very perceptible upon passing from one car to the other in the same train, and that they find no difficulty in reading books or papers with ease and comfort while riding upon the air spring. Without doubt, they may be adapted to omnibuses, pleasure carriages, etc., and we hope soon to see them in Broadway.

"The philosophical principle of the permanent elasticity of atmospheric air, is now attracting great attention both in this country and Europe, and if other applications of this principle are as successful as in the present instance, great and important results will follow.

"They are manufactured by the proprietors of the patent, New Haven, Connecticut. Sherman & Mearns, 76 Broad street, New York, agents."

## Postoffice Department and the Railroad.

There appears to be a growing difficulty between the postoffice department and the railroad interest; and the people—the business community—are to be the sufferers. Formerly it was customary to pay extra prices for extra speed—as well as increased prices for increased service. Increased speed has always been deemed an important matter with business men who pay for the transportation of the mails.

The prices paid for transporting the mails in post coaches, and wagons, on the main lines, at one-quarter or one-third of the speed of railroads, was, if we recollect, quite as much, in proportion to the quantity carried, as it is now on railroads. If speed is worth anything to the business community, that community, through its agent having charge of that department, should pay a fair compensation to those who, by a large outlay of capital, are enabled to attain the speed so highly valued.

We are very far from wishing to give to the railroad companies the control of the postoffice department, as we also are of allowing the postmaster general to require services of the companies without a fair compensation.

We are led to refer to this subject, at this time, from the notices we have recently seen in the newspapers in relation to the controversy between the postmaster general and the Richmond, Fredericksburg and Potomac railroad company. It was stated in the first notice of it which met our eye, that the

company demanded an increase on former prices—of \$3,750—which the department declined to give, and were of course compelled to resort to some other mode of carrying the mail from Washington to Richmond, 131 miles, and therefore proposals are requested, and the time allowed in the schedule is 23 hours, instead of 84 hours as now allowed. It is true, we understand, that in reply to the regular advertisement for proposals on this route, an advance, something in proportion to the increase of the weight carried, or service rendered, was asked by the company, but—*notwithstanding* theirs was the only bid—the postmaster general declined it, and even refused to give them the same rate of compensation that they had received for the past four years—*notwithstanding* a large increase of service required.

We understand that the company did not *decline* the service at former rates, even though they had proposed for higher. Yet they did refuse to continue the service after the 10th of December next, at the rate offered by the department, which was \$3,217 less than they had agreed on in 1842 and 1843, and had received for slower schedules and inferior service.

The question is now to be decided whether the company shall do more work for less compensation, or the mail service shall be retarded 16 to 24 hours between Washington and Richmond.

It is but fair and just to those who risk their capital, that the traveller and the mail may be transported at higher velocities, should receive returns in some proportion to the advantage his investment gives to the community, and we therefore suggest that the compensation for carrying the mail shall be in proportion to the *quantity and speed*; and recommend that a law be passed, by which these controversies may be avoided—as otherwise the rapid extension of railroads will give rise to frequent controversies.

The following statement of the railroad company shows their position:

OFFICE RICHMOND, FREDERICKSBURG & P. R. R.,  
Richmond, November 3d, 1847. }

To the Editors of the *Whig*:

GENTLEMEN:—As you have published from the Baltimore Sun an extremely partial view of the existing difficulty between this company and the post-office department, I cannot defer placing in your possession an extract from the minutes of our board of directors in relation to the subject. Though not so copious as the correspondence, (which will soon be placed before the public) it is plain enough, I think, to satisfy any unprejudiced mind, that the demands of the department for increased service—the necessary consequence of the rapid expansion and growth of our country—will sustain the companies in the position taken by them, which is, to submit to no reduction in the compensation allowed them for several years past, and which they are assured by eminent counsel, it is fully in the power of the department, under the law, to continue to them.

Very respectfully,

ED. ROBINSON, *President*.

At a meeting of the board of directors of the Richmond, Fredericksburg and Potomac railroad and Washington and Fredericksburg steamboat companies, held at the depot in Richmond, October 26th, 1847:

The president stated that the postmaster general had awarded to the two companies the sum of \$7,258 75 for carrying the mail between Richmond and Washington for the quarter ending on the 1st inst., instead of the sum hitherto paid by the department, being a reduction at the rate of \$3,217 per annum on the compensation agreed on in 1842 and 1843 for

slower schedules and inferior service, and when the mails were much lighter than at present, and that the postmaster general had requested, if this compensation was not satisfactory, that the board of directors would give at least twenty days notice to that effect, when other means of transportation would be provided by the department; whereupon,

*Resolved, unanimously*, That the president respectfully notify the postmaster general, that, while the board of directors deem the compensation offered by the department an inadequate one for the services rendered by the companies at other seasons of the year, it is, in the opinion of the board, entirely so for the winter months, when the extra expenses and hazard incurred by the steamboat company *alone*, in the transportation of the mail, beyond those of other steamboat lines, are greater than its whole mail pay at that season would cover; and that the board of directors must reluctantly decline the further transportation of the mail on the terms offered by him after the 10th day of December next, when the winter schedule commences.

An extract from the minutes:

C. W. MACMURDO, *Secretary*.

#### Iron Trade.

The report of 8th October, quote rails at £9 average—"Yet," says a correspondent of the Mining Journal, "owing to the state of the money market, the transactions in metals have been very limited of late, but the prices have been generally well maintained; the only articles on which we have to decline, are Scotch Pig-Iron and Spelter—all other prices remaining at last week's quotations."

*Glasgow Pig-Iron Trade*.—Our pig-iron market is feeling the effect of the late commercial disasters. Prices are receding every day, and may now be quoted at 57s. 6d. for No. 3; 59s. 6d. for mixed Nos.; and 61s. for No. 1—cash; a limited business doing.

#### MONTHLY REPORT.

(From a Correspondent.)

*Iron*.—Notwithstanding the state of the money market, and the many disasters which have recently taken place, both here and in the provinces, the iron trade in Wales and Staffordshire has maintained its firmness. The Welsh ironmasters are actively employed in carrying out their contracts for bars and rails; and such is the demand for the former, that it is difficult to get any of the makers to execute orders unless at extreme prices. The Staffordshire trade is also brisk, with no disposition to give way in price. Scotch pig has been much depressed during last month, owing chiefly to large parcels in the hands of speculators being forced on the market, and a decline of 3s. to 4s. per ton has taken place within the last two or three weeks. In Swedish iron and steel there is not much doing; a few sales of the former have been made, principally for the American market.

The Birmingham Advertiser holds the following language in relation to the iron trade, viz:

"The preliminary meeting of the ironmasters of this district took place on Tuesday, at Wolverhampton; and we are happy to state, that the result was satisfactory. The prices of manufactured iron (bars, hoops, and sheets), remain the same. The home demand is very good, and this, considering the time of the year, and the fact that the shipping season will be soon drawing to a close, fully warrants the conclusion arrived at by the trade. Pig-iron maintains its price—the principal makers are already full of orders for the next quarter's delivery; indeed, the quantity made in South Staffordshire is not equal to the demand. So much is being used for casting, for railway, and other purposes, and so large a quantity is converted into manufactured iron, that were it not for the pig-iron imported from other districts, the scarcity would, we have no

doubt, be material. There cannot be any considerable reduction, either in the price of pigs or manufactured iron, so long as the value of labor is so high, the raw material so dear, and the demand so great. The large failures in the City, and elsewhere, have not, as yet, affected the iron trade; it is true that several iron merchants have failed, but the business done by them in this district was very limited. Notwithstanding the pressure upon the money market, we have every reason to believe that the engagements will be promptly met, and payments punctually made at the ensuing quarter-day. The manufacture of railway bars is a distinct branch of the iron trade, and the price is not settled at the general meetings. The requirements of *bona fide* railway companies—of those who can afford to pay for the rails contracted for, and who cannot do without them—will be sufficient to keep this department of the trade in full operation for some time to come; indeed we speak advisedly, when we declare that we have not heard of one single order for rails being postponed through 'railway embarrassment.' That the iron trade should pass through a great commercial panic, meet the heavy pressure in the money market, and not be ultimately affected by it in some degree, is almost too much to be expected; but, we believe, when the panic is over, and the pressure is removed, it will be found that the iron trade has been comparatively unaffected, or, at all events, that it has enjoyed an extraordinary exemption."

The report of the 15th October shows a depression in the price of rails, as compared with last week. The quotations being £8.10 a £9, average.

Welsh iron may now be generally bought for £8 12s. 6d. in Wales, the demand continuing fair for this description, and also for Staffordshire. Scotch pig is dull of sale.

*Glasgow Pig-iron Trade, Oct. 14*.—Our pig-iron market has rather improved this week; there is, however, very little business doing. Mixed Nos. may be quoted at 60s. to 61s.—cash.

*The Iron Trade*.—The usual quarterly meeting of the ironmasters of South Staffordshire and Shropshire, commenced at Walsall, on Monday: the second, and more important one, was held at Wolverhampton, on Wednesday. The attendance of those interested in the trade was numerous, but any details are rendered unnecessary, as the terms agreed to at the preliminary meeting last week, were fully confirmed.

The ironmasters held their usual quarterly meeting at the Town-Hall, Birmingham, on Thursday last—the attendance at which was unusually numerous; and the reports of all engaged in the trade confirmed that which we have already announced, relative to its healthy condition. There are still large orders in the houses both for home and foreign requirements, and, as a consequence, a determination has been arrived at to stand by existing prices. The figures are—for Staffordshire bars, £10, for pigs £4 15s. to £5 5s. per ton, according to the quality. We have reason to believe, too, that there has been less of underselling by the smaller makers during the quarter just ended, than has been known for several years. The settlement of accounts has passed off satisfactorily, the difficulties caused in other parts of the country, consequent on the very serious monetary panic, not having yet, we are assured, affected, to any extent, the trading interests of this district. Reports, which have been current for a day or two respecting the unsatisfactory condition of the affairs of a company interested in the iron trade and working out a patent, have to-day re-

ceived confirmation. We understand that a meeting of the proprietary will be convened forthwith, and that a proposition will be submitted whether it is expedient to make another call, or at once to wind up the concern. It is most probable, that the latter alternative will be resolved upon, but in no case will the creditors suffer to the extent of a fraction. On a rough calculation, it is not improbable that at the present time the company is employing 2000 pairs of hands. The continued satisfactory condition of the coal trade is the only other fact we have to report; upon the whole, the aspect of the commercial concerns of this district affords, when contrasted with those of other parts of the country, matter for much congratulation.—*Birmingham Adv.*

#### Anthracite Iron.

The anthracite district of South Wales, says the Mining Journal, seems to be rising rapidly into importance in the production of iron. Ten years ago there was only one establishment, of three or four furnaces, in operation at Yniseddwyn, in the Swansea Valley—now there are no fewer than nine concerns, possessing 33 furnaces, of which 23 are actually in blast at this time. The following are their names, with the number of furnaces in and out of blast:—

Furnaces.	In blast.	Out.
7.... Yniseddwyn—(Mr. Cranes')....	7....	0
11.... Ystalyfera—(Budd & Co.)....	7....	4
2.... Ynallt—(Jevans & Wood)....	2....	0
3.... Gwendraeth.....	2....	1
2.... Oallyn—(Williams).....	2....	0
2.... A'ernant—(Neath Abbey Com.)....	2....	0
2.... Trinsaran—(Norman & Co.)....	1....	1
2.... —(Lewellyn & Sons) unfin'd....	0....	2
1.... Banwen.....	0....	1
32.....	23.....	9

With a fuel so difficult to deal with as anthracite, the quantity of iron produced by each furnace is not as large as the furnaces in the bituminous districts of Wales and Staffordshire turn out, but the quality is acknowledged to be of a very superior character, as is proved by the large quantities which are sent to the mills and forges in Staffordshire. Taking the average production at 50 tons each furnace per week, the whole make of the 23 furnaces in blast is 1150 tons per week, or 59,800 tons per annum—a quantity by no means insignificant. Besides the furnaces already mentioned, there has lately been erected at Briton Ferry, near Neath, a powerful mill for rolling bars and rails from anthracite iron, and capable of turning out about 400 tons per week.

The Madison and Indianapolis Railway, earned nearly twice as much in September, this year, as it did last year. This road will probably be extended to La Fayette, and thence to connect with the Michigan roads. A road will also be constructed to the Ohio State line, and thence form a connection with the Ohio roads at Springfield, or some other favorable point, thus opening communication with Cincinnati and Lake Erie—and another road will, at an early day, be constructed westward towards Illinois—thus making Indianapolis a central point in the Railroad system of the West.

The Detroit Free Press says that arrangements have been made with the Buffalo and Mississippi Road to connect with the Michigan Central Road at the Indiana State line South of Niles. The road will then go through Laporte and Michigan city to Chicago, and thence to Galena. At the Indiana state line the road will be tapped, and thence go to La Fayette, Ia.

The connecting road from Chicago to Galena

will soon be commenced. The citizens of Chicago have taken near \$200,000 of the stock, and over \$100,000 were taken on the route. An agent is now, we understand, in Boston in behalf of the company, soliciting subscriptions to the stock, and he will be very likely to meet with encouragement.

Over 1500 men are, as we are informed, employed on the New York and New Haven Railroad. The whole work is under contract, and the work is progressing with great rapidity.

Three divisions of the St. Lawrence and Atlantic Railroad, of about 50 miles in extent, are in progress in the State of Maine, a part of which is to be completed within a year.

The receipts of the Housatonic Railroad, for the month of September, amounted to \$19,173 53. A semi-annual dividend of four per cent. has just been declared. This company deserves success. They have worked hard to construct and re-construct their road—and we hope they may realize rich returns.

The receipts on the Little Miami Railroad (in Ohio,) during the month of September, exhibit an increase of \$6,434 over the same month last year. In September, 1845, the entire receipts on this road were only \$6,607. This company is now engaged in good earnest in rebuilding their road, and they intend to have it one of the very best roads in the country—within two years.

#### Bridge Building, both Iron and Wood.

It may be recollected by our readers that we sometime since—see No. 23, June 5th—referred to a small treatise on this subject, by Mr. S. Whipple of Utica. We also previously published, in No. 19, for May 8th, a communication from an eminent engineer, highly approving of Mr. Whipple's work and system of Bridge building. At the close of the treatise above referred to was an intimation by the author of his intention soon to publish, "as a sequel" to what he then gave, "a set of working plans for bridges of different lengths and descriptions, both of wood and iron, with details, specifications, and general remarks;" and in accordance with that intimation he has put forth a neat little volume, including what he then published, of 120 pages, with 10 plates illustrating the subject, which ought to be in the hands of every engineer, bridge builder, and road maker in the country.

We may hereafter make extracts from the work, by way of calling the attention of our readers specially to it, but at present conclude this notice with the following remarks of Mr. Whipple upon the disaster of the "Dee Bridge,"—which fell under the passage of a Railway train; a few months since, with a melancholy loss of life,—and with a hearty recommendation of it to those having charge of railways, or engaged in bridge building.

The author says, in relation to "The Dee Bridge:"

A considerable degree of excitement has been caused within a few months in England, by the failure of a bridge over the river Dee, near Chester, during the passage of a railroad train, by which accident several lives were lost.

As the facts of the case may afford an instructive lesson upon the subject treated of in the preceding pages, I am inclined to state the most important of them, with a few accompanying remarks, before taking leave of the subject.

The bridge in question, was upon the plan called the "Cast Iron Girder Bridge."

In this plan, each track, or pair of ways, is supported by two cast iron Girders, or

beams, with their ends resting on abutments and piers, which, in the case of the Dee Bridge, are 98 feet apart. The form of the Girders is essentially that of the common railway bars, known as the  $\perp$  or  $\pi$  rail; the vertical "web" being two and one-eighth inches thick, by about three and one-half feet deep; the lower flange, twenty-four and one-half inches wide by two and a half thick, and the top flange, about seven and a half inches wide, by a little less than two inches thick; the whole cross section containing 160 square inches, and the whole depth being 45 inches.

In addition to this, are wrought iron suspension bars, containing 60 square inches of cross section, running obliquely downward from a connection at the ends, about 3 feet above the upper flange, (there being a rising portion at the ends to which such connection is made,) to the lower flange, at the joints of the cast iron part, 36 feet, or one-third the length of the girder, from the ends; the casting being in three pieces, connected by bolting through flanges, and by strengthening pieces at the points. Between the two joints, the suspension bars run horizontally, just above the lower flange of the girder.

One effect of these suspension bars is, to throw a great amount of thrust, or crushing force upon the top flange, in so much that the engineers who examined and testified upon the subject, upon the inquest held in relation to the lives lost by accident, generally concurred in the opinion that they rather weakened than strengthened the girder. Adopting that conclusion upon this point, which appears to be corroborated by experiment, let us examine whether the failure of the bridge, in connection with the other facts of the case, should inspire distrust, or confidence in the use of iron bridges for railroads.

By calculation according to formula deduced from experiment, a pair of girders is estimated to be able to sustain at the extreme or breaking point, 148 tons in the centre, or 296 tons distributed uniformly over their length. In this estimate, the testifying engineers concur with little or no variation. Now, the weight of a pair of girders, is about 70 tons, or, with other parts of the structure, about 90 tons. Mr. H. Robertson, (engineer,) estimates the effects of the engine and tender as "equivalent to 32 tons in the centre," which is equal to 64 tons distributed. Add to these, "25 tons of ballast," which was put on to the bridge just before the accident, and we see there was 90, 64, 25=179 tons upon the bridge, which was more than six-tenths of the actual breaking weight, supposing it all at rest, and acting equally on the two girders. But the action of the engine, and the vibration of the girders, (which must be considerable for a length between supports equal to 20 times the depth,) must be very important, though not capable of exact estimation. It is therefore not improbable that the girder was taxed to more than two-thirds of its extreme capacity under favorable circumstances.

Now, from one-quarter to one-third of the actual breaking strain, is all that any practi-

cal engineer estimates it safe to rely on cast iron to bear; whereas, in case of the Dee bridge, we see it exposed to a load of more than six-tenths of the ordinary capacity, besides the effects of motion, vibration, etc. It certainly cannot be surprising, then, that a failure took place. And so far from this failure amounting to evidence, or even an argument, against the safety of iron bridges, the fact that this is the first and only failure that has yet taken place, among "upwards of 100 similar bridges, either in use or in the course of construction, in England," some of which are doubtless, often exposed to strains exceeding half their absolute capacity to bear, seems calculated to inspire the fullest confidence, that, properly proportioned, so as never to be exposed to a stress of more than one-fifth or one-quarter of the average strength of the metal, iron bridges may be relied on with the utmost confidence.

We see that the Dee bridge contained some 70 tons or more of iron in the girders, for a single track of 98 feet stretch,\* besides 20 tons in the other work, which is nearly one-third of the actual breaking weight of the girders; and as much or more than they ever should or could with safety be exposed to.

The English engineers seem to me to have erred, in deducting the weight of the structure from the *breaking weight*, instead of the *safe load* of the girders, to obtain the effective strength.

Now, that the most eminent engineers, of a most scientific nation, should be obliged to avail themselves of the extensive employment of such a plan of structure as that, is evidence enough of a prevalent want of more light upon the subject of *Bridges*. And whether my labors in the field will have aided essentially towards supplying the deficiency, it is unnecessary for me to give a more direct expression of opinion, than will be afforded by respectfully offering these humble essays to the attention of the engineering profession.

#### Railway Carriages or Cars.

We perceive by the following description, given by the Illustrated London News, that prejudice, or custom is at length yielding to experience, and that the 8-wheel car is now likely to be introduced upon the English railways. We have been not a little surprised that the old—or early—style of car, upon four or six wheels, divided into three or four apartments, to contain six or eight passengers each, maintained its place on the English railways so long after the superior convenience and safety of the 8-wheel car was discovered. The Messrs. Adams have however opened the door for the introduction of valuable improvements, which will be adopted on most of the important lines.

We give a sketch of one of the improved railway carriages, just constructed by Messrs. Adams, of Fair Field Works, Bow, for the North Woolwich branch of the Eastern Counties' railway, and we consider the directors to have shown judgment in their departure from the common standard, to suit an increasing traffic, without adding to the length

\* I estimate the amount of iron for a like stretch upon my plans, at about 15 tons.

of their trains. These carriages are 40 feet in length, and 9 feet in width; the extra width being gained by building the carriage frames to the width of the ordinary step boards. The directors have thus succeeded in accomplishing more on the narrow gauge than has yet been accomplished on the broad gauge, where the carriages are only 8 feet 6 inches in width, by 28 feet in length. The extreme axles are 30 feet apart, and, being on eight wheels, these carriages are obviously safer than those on six wheels or on four.—Notwithstanding their length, they will pass a curve of 200 feet radius by means of the flexibility and arrangement of the springs, which permit the wheels to traverse laterally. The buffer heads are also made to radiate with the springs or curves, so that they press firmly under all circumstances. The carriages are fitted up in four compartments; one first class, with couches all around, and a table in the centre; the other three, second class. They will carry about 110 passengers.

Among the advantages which these improved carriages present over ordinary carriages, are—

1. Greater steadiness at high velocities, the great length of the body maintaining its equilibrium independently of the wheels.

2. Diminution of friction, by the easy spring permitting free rolling movement of the wheels, without pressing the flanges against the rails, whether on curves or on nominally straight lines. Also by diminution of the gross weight of the carriages, as compared with the passengers carried.

3. The proportional diminution of requisite engine power, equal to fully one-third as compared with the traction of six-wheeled carriages.

4. Reduction of the length of trains, by increasing the breadth of the carriages.

5. Greater safety; since one wheel breaking out of eight involves far less risk than one out of four or six. The almost impossibility of getting off the rails, on account of the perfect action of the springs, which will keep the wheels turned to the plane and curves of the rails, whether regular or irregular, instead of confining them to the plane of the carriage.

The allowance of a passage way through the whole of the interior of the train for the guards, would be important, in case of the illness of a passenger, or a fire, or other accident. In second and third class carriages, the arrangements for passing through would be as in the pit of a theatre—a passenger could move aside so as not to lose space. In a first class carriage, a passenger way, 1 foot 6 inches wide, would be left, and passengers' cabins arranged on each side, facilitating the use of small private apartments, where required for long journeys. The communication through the whole train would permit the collection of tickets during the journey. At present, a journey of 50 miles is frequently performed in little more than an hour, with some additional risk from high speed; and, at the end of the journey, a quarter of an hour is wasted in taking tickets.

#### Railway Statistics of England for 1846.

We find the following extract from the Statistical Journal for September, in the Railway Record. It shows that the total receipts of these 23 roads, for six months, was over \$20,000,000.

"In the Statistical Journal for September, is a table of the revenue receipts, increase of traffic, dividends, etc., on railways, for the half-year ending December, 1846, compiled by J. Wishaw, Esq., who is, no doubt, well known to the majority of our readers, as a frequent speaker at railway meetings. From this document we present to our readers the following abstract."

**Bristol and Exeter.**—On this line, (76 miles included in the Great Western) the receipts were £49,683 2s. 3d., being an increase on the corresponding half-year of 1845, of £1,144 10s. 3d. The dividend declared was £1 13s. 9d., which left a balance in hand of £2,055 15s. 5d. The line is leased to the Great Western at a fixed rent of £71,957 per annum, and a toll of 4d. per mile for every passenger travelling upon it, and the same for every ton of merchandize carried.

**Dublin and Drogheda,** (35 miles)—The receipts, £21,408 17s. 3d., being an increase on the corresponding period of 1845, of £644 15s. 3d. Dividend declared at £3 14s. per cent. It appears there is a falling off of 10,000 in the third class passengers.

**Eastern Counties** (161 miles)—The total receipts were £250,056 8s. 9d., being an increase over the corresponding period of 1845 of £69,956 12s. 6d. The dividend declared was 10s. per share, leaving a balance of about £329 in hand. During the last six months, the increased length of road maintained was 59 miles.

**Edinburgh and Glasgow** (46 miles)—The receipts were £111,087 16s. 6d., being an increase of £26,570 4s. 10d. over the corresponding period of 1845. The dividend declared was 8 per cent., and the balance after its payment, £12,983 2s. 11d.

**Glasgow, Paisley & Greenock** (22½ miles.)—The receipts were £28,982 18s. 3d., being an increase over the corresponding period of 1845 of £2,479. The dividend declared was 6s. per share on £25 shares, and the balance left in hand £716 7s. 3d.

**Glasgow, Paisley, Kilmarnock and Ayr,** (51 miles)—The total receipts were £60,645 6s. 6d., being an increase of £7,000 on the corresponding period of 1845. The dividend declared was 7 per cent., and a balance in hand, after paying the dividend £2,095 16s. 6d.

**Great Western** (240½ miles.)—The total receipts were £513,846 15s. 10d., the dividend 8 per cent., and the balance left in hand £7,853 14s. 10d. This includes the receipts on the Bristol and Exeter line. There was an increase in the traffic of the half year of 92,598 passengers, and 23,976 tons of goods, but no apparent increase in the receipts.

**London and Blackwall** (4 miles.)—The total receipts were £43,801 6s. 9d., showing an increase over the corresponding half year of 1845 of £3,548 4s. 3d. Dividend declared 4s. per share.

**London, Brighton and South Coast** (112 miles).—The total receipts were £226,711 7s. 11d., the increase over the corresponding period of 1845 £48,984 6s. 5d., and dividend declared 7 per cent. In the course of six months the extent of this line was nearly doubled.

**London and North Western** (362 miles).—the total receipts were £1,110,795 0s. 10d. the increase over the corresponding period of 1845 £61,566, the dividend declared 10 per cent., and the balance left in hand £105,722.

**London and South Western** (99 miles).—Total receipts, £196,323 5s. 2d., dividend declared, £2 2s. 6d.; and balance remaining in hand, £200. The receipts somewhat diminished in consequence of the reduction of passenger fares.

**Manchester and Leeds** (117½ miles).—The total receipts were £187,524, the increase over the corresponding period of 1845 £3388, the dividend declared 7 per cent., and the balance remaining in hand after paying the dividend £41,124. The opening of the Ashton branch during the six months tending to increase the receipts, and of the Sheffield and Manchester, and Leeds and Bradford lines to diminish them. The receipts were also affected by a reduction in the passenger fares.

**Manchester, Sheffield and Lincolnshire** (49½ miles).—The receipts on this line were £55,277 15s. 5d.; the increase in the corresponding period of 1845 £19,875 10s. 3d., and the dividend declared 5 per cent.

**Maryport and Carlisle** (28 miles).—The total receipts were £15,151 9s. 10d., being an increase on the corresponding half year of 1845 of \$4,865. No dividend declared.

**Midland** (328½ miles).—The total receipts were £401,790 19s. 4d.; the increase over the corresponding period of 1845 £55,498 2s. 10d.; the dividend declared, 7 per cent., and the balance left in hand £13,040 8s. 1d.

**Newcastle and Carlisle** (61 miles).—The total receipts were £57,156 5s. 1d.; the increase over the corresponding period of 1845 £9,723 6s. 2d., and the dividend declared 5½ per cent.

**Norfolk** (58½ miles).—The total receipts were £45,639 1s. 2d.; the increase over the corresponding period of 1845, £7,158 17s. 6d.; and the dividend declared, 3 1-2 per cent. on consolidated stock.

**North British** (72 1-2 miles).—The receipts for seven months were £53,281 15s. 5d., the dividend declared 5 per cent., and the balance left in hand, £84 5s. 3d.

**South Devon** (15 miles).—The receipts, from the opening of the line to Teignmouth, on the 29th of May, 1846, were £15,620 5s. 7d. No dividend declared.

**South Eastern** (140 1-4 miles).—The receipts were £236,404 0s. 5d., the increase on the corresponding period of 1845, £51,860 8s. 9d., the dividend declared 2½ per share on the paid up shares, and the balance remaining in hand, £7,454 7s. 3d.

**Ulster** (25 miles).—The receipts were 18,987 2s. 5d., and the dividend declared £1 per share, leaving a balance in hand of £1,130 7s. 8d.

**York and Newcastle** (149½ miles).—The receipts were £158,181 2s. 9d., including the receipts on the Richmond branch, opened in September; the increase over the corresponding period of 1845 £21,051 14s. 6d., and the dividend declared 9 per cent., leaving a balance in hand of 504 19s. 4d.

**York and North Midland** (162 1-2 miles).—The total receipts were 186,752 0s. 10d., and the dividend declared 10 per cent., leaving a balance in hand of 17,213 17s. 9d.

The total length of the above lines is 2,340½ miles; and the receipts during the last half of the year 1846, were 4,036,145 4s. 3d.

#### Railway Across the Isthmus of Panama.

For many years the grand projects of either cutting a navigable ship canal, or constructing a railway across the Isthmus of Panama, to join the Pacific with the Atlantic, has been the study of several eminent engineers—English, French, and Italian. Plans and estimates have been made out of the expenses and practicability of so important an undertaking, but hitherto so much opposition had been experienced by each party from the Government and authorities in carrying out the project, that, for a time, it has been in a state of abeyance. Several French adventurers have been foremost in this speculation; and, after very unsuccessful communication with the Government, they have at last succeeded in obtaining a concession to lay down a railway across the Isthmus, under certain conditions—that at the expiration of the term of the lease it then becomes the property of the State, which, however, can grant a new lease to the company. From the report of the engineer, it promises to be a very lucrative speculation, and can be carried out with but little obstacles, as the country is of a nature that the cuttings and embankments, tunnels, etc., will be without much difficulty, and a comparatively low expense, compared with European lines. The company will be partly composed of English, French, and Mexicans—the Government granting the land through which the line will run. After mature deliberation, the cutting of a canal has for the present been abandoned, although its practicability is beyond doubt, and may, some years hence, be accomplished. The establishment of a railway will afford not only a rapid transit for passengers and goods, but to the mining interest of Chili it will be most important, as also for the city of Mexico. By the facilities afforded by the South, Pacific Steam Navigation from Valparaiso, calling at all the ports between that Liverpool of South America, and Lima, etc., the miners will be able to overcome the great drawback, which has hitherto been so severely felt—the want of a quick means of transporting the metal and ore. Arrangements are making by the Royal West India Mail Steam-Packet Company to call at Chagres and Vera Cruz twice a month, on and after November next, instead of once, as at present—an advantage that, no doubt, will be highly appreciated by all those embarked in mining adventures in Mexico, Chili, Peru, etc.

It is possible that the Americans may also be somewhat interested in the management of the railway across the Isthmus of Panama when it shall be built, although they appear to have been forgotten by the writer of the above paragraph, which we take from the London Mining Journal of September 11th.

#### Railway Train Signals.

There appears to be much interest manifested in England at this time in relation to the introduction of improvements in the mode of communication between the guard, or look-out men upon the train, and the engine driver. There seems to have been much difficulty upon this point; and that accidents have occurred in consequence. Various plans have of late been suggested—some of which we give to our readers that they may have the benefit of them, if superior to our simple and efficient mode of a cord running over the tops of the cars to the engine, where it is connected with a bell—thus giving the conductor an easy means of stopping the engine, if necessary. One of the several plans suggested is described as follows by the Morning Herald.

"We yesterday," says the writer in the Herald, "availed ourselves of an opportunity of inspecting, at the carriage manufactory of the Messrs. Adams, near Stratford, a break van, in which provision is made for enabling the guards of a train to communicate with each other, and with the driver of the engine. The mode proposed for effecting this is very simple. One of the ends of the break van has an elevated compartment, with glass windows before and behind, through which, when the van is placed next the tender, the guard can command a view of the whole train, and also of the driver. It is proposed to have one of these vans next the tender and one in the rear of the train, and that by means of a strong length of catgut running along the sides of the carriages, a communication shall be kept up between the two guards. The way in which this is to be performed is, we understand, as follows: The under guard in the rear break van is to have in his charge a roller on which the catgut will be wound, and it will be the duty of the head guard, immediately the train is ready to start, to walk from the rear of the train, and, in his way to his own break van next the tender, insert, by a very simple contrivance, and without stopping, the catgut in one or more rings fixed to the sides of the top of each carriage. The catgut will then be attached to a strong spring in connection with an alarm in a break wagon next the tender. The roller on which the catgut is to be wound in the rear break van will be connected with a weak spring, having sufficient play to prevent the contracting and expanding motion of the buffers acting upon the strong spring in the front break van, and letting loose the alarm. If the guard in the rear desires to communicate in the day time with the one in the front, the alarm is sounded and the required signal given by flag. If by night, the signal is given by lamp. In this way the guard in the rear will be able to communicate almost instantaneously with the guard in the front of the train, and the latter, by a communication with the driver through the mode we suggested yesterday, viz: a chain or wire in connection

with a steam whistle on the engine, can exhibit a red flag or red light, and stop the train in the shortest time practicable. If it be desirable to place the passengers in communication with the head guard in the front brake van, the catgut might be placed within their reach. The head guard would readily distinguish the passengers' signal from that of the rear guard by the absence of a flag or lamp signal in the rear break van. We are quite aware that the objection to this apparently simple mode of signalling from all parts of the train to the head guard will be that the catgut must be withdrawn from and reinserted in the rings whenever a carriage is added to or taken from a train. This objection might be surmounted by having the catgut in lengths, with spring clasps of a form that would run easily through the rings. The merit of this contrivance, which seems to possess simplicity and effectiveness, belongs to Mr. Grimshaw, the superintendent of the Bishopsgate station of the Eastern Counties."

#### Copper Mining and Copper Ore.

We have heard much of the "copper region," and of "copper stocks," of Lake Superior, and have seen some remarkable specimens of the metal brought from there as samples, yet we have seen nothing equal to the following statement, which we find in the last number of the American Mining Journal, as an indication of the success attending the mining operations of those engaged there. If the statement herein made be true, that these 467 tons of ore will produce as much metal as 3600 tons of the dressed ore of the Cornish mines, or as 7200 tons of that ore as raised from those mines, and the supply of this ore is as inexhaustible as it is represented, then we may look for a great reduction in its cost, and immense increase in its use in all departments of business! It must not be forgotten that we are not alone in our discoveries of copper mines—equally valuable mines have been discovered in Australia, and large investments of English capital have been made in them—of course there is to be competition in the business, and consequently increased supply and reduced prices and profits.

The writer says:—"The prospects of the Pittsburgh and Boston Copper Harbor company, through their famous 'Cliff mine,' are in the highest degree cheering. This mine was discovered in the autumn of 1845, at a season so unfavorable, as not to afford time sufficient for the usual preparatory mining arrangements of the succeeding winter; and still, in less than two years from the period of its discovery, the produce has not only equalled the whole cost of working it, but will undoubtedly yield a profit to the proprietors! The history of mining hardly affords a parallel to this mine; for not only two, but even five or more years are generally requisite, with heavy outlays, before mines in general are enabled to cover expenses, and give dividends. The most astonishing results are even now produced, through the abundance and richness of its native metals; and the wonders of Aladdin seem to be realized through the extraordinary developments that are making in it.

From reliable data, it appears, that the product of this mine for the present season, up to the 25th of September, delivered at the

lake shore, equals 467 tons of masses and copper rock.

Of this, there have been received at the seaboard, mostly at Boston, . 209 tons. There are on the way to Boston—this side of Buffalo, . . . 178 " And there were at the lake shore, Sept. 25th, . . . 88 "

Making a total of, . . . 467 "

Much more than half of the shipments consists of masses. In order to show this, it is sufficient to state, that the 209 tons named above, consisted of barrels of copper rock, weighing 361,506 lbs. and the masses weighed 296,266 lbs.; and that these proportions continue in the other 258 tons. The weekly return of the clerk of the company, at the mine, for the week ending Sept. 18th, was—

40 barrels,	14,526 lbs. net.
18 rocks,	17,132 "

Total, . . . 31,658 "

This week's return is smaller than usual, on account of the masses taken out being so large, as to require more time to cut them into suitable pieces for shipment.

The returns for the week ending Sept. 25, gave—

37 barrels,	13,774 lbs. net.
26 rocks,	31,030 "

Total, . . . 44,804 "

The clerk says:—"We would have sent 25 tons this week, but this being a wet day, prevented us from doing so. The mine wears the same appearance as usual. There was a mass of about 20 tons blasted, down in the north end of the lower drift on Friday night, but we cannot tell how long it will take to cut and blast it into smaller pieces."

It is understood that the drift where this mass was found, was 60 feet below water level; and it, of course, furnishes conclusive evidence of the richness of the mine at that depth—a most important point in the valuation of the mine.

The company have sold the masses and copper rock to smelters, for 16 cts. per lb., for the copper they will produce. From average samples, it has been determined, that the masses yield about 80 per cent. of copper, and the ore, in barrels, about 60 per cent.—Having this data for a guide, the 467 tons must yield to the company nearly \$100,000.

Allowing that these 467 tons will give 300 tons of pure copper—a low estimate—the same would be equal to about 3600 tons of the dressed ore of the Cornish mines, or more than 7200 tons of ore as raised from those mines.

From the great richness of the copper rock, it is right to suppose that a large quantity of inferior quality has been raised, that remains at the mine. This is so, and the quantity is represented as being several thousand tons in weight. Hitherto, for want of proper machinery, this rock has not been reduced; but it is supposed that a suitable apparatus has, by this time, been erected at the mine, and that, if it should operate favorably, it will add much to the revenue of the company.

There appears now to be nothing in the way of this mine's continued successful operation. It has been already sufficiently opened, to show that sufficient productive ground is yet untouched to keep a large mining force at work for many years, and that no bounds have yet been found to the copper at any depth to which excavations have been made."

#### Smithsonian Institute.

The following exposition of the plan adopted for the management of this Institution, will, we doubt not, be read with interest, and therefore we give it a place in the Journal. We copy it from the Mining Journal.

From a paper read by Professor Henry before the Association of Geologists and Naturalists, at Boston, on the 25th ult., we learn that Hugh Smithson was born in England, in the year 1868. He was educated, says the learned professor, at the University of Oxford—was a man of amiable disposition, and devoted to science. He was the best chemist in Oxford, and, after his graduation, became the rival of Wollaston in minute analysis, and possessing most extraordinary skill in manipulation.

He resided most of the time abroad, and was an illegitimate son of the Duke of Northumberland, who recognized him and left him a handsome property. He was the author of upwards of twenty original memoirs, on various subjects of science. He appears to have been proud of his scientific attainments, and on one occasion wrote thus: "The blood of England flows in my veins—on my father's side I am a Northumberland—on my mother's I am related to kings. But this is of no consequence. My name shall live in the memory of mankind, when the titles of the Northumberlands and Percys are forgotten." Professor Henry said he could find no evidence that he had written this in view of the establishment of an institution.

Smithson died at Genoa, in the year 1829, leaving his property to his nephew, the son of his brother, with a clause in his will leaving it to the United States, for founding an institution for the increase and diffusion of knowledge among men, in case the nephew died without issue. He did so die, and the money, about \$500,000, came into possession of our government. It was idle to say that this money was lost, when it was lent to Arkansas and other States. It could not be lost for the national government held it in trust, and having accepted the trust was bound to see it devoted to the purpose designed in the will of Smithson. Various schemes had been proposed to carry the plan into execution, but none was definitely decided upon until a year since, when an act of Congress was passed organizing the institution. Professor Henry then explained his own connection with the Smithsonian Institution, which was entirely unsolicited on his part. He mentioned the several plans which had been suggested for the organization of the institution, as well as that which had been finally adopted as a compromise. According to this,

To increase knowledge. It is proposed, 1st, to stimulate men of talent in every part of the country and of the world, to make origi-

nal researches by offering suitable rewards; and, 2d, to appropriate annually a portion of the income for particular researches, under the direction of suitable persons.

To diffuse knowledge. It is proposed, 1st, to publish a series of periodical reports on the progress of all branches of knowledge; and, 2d, to publish occasionally separate treatises on subjects of general interest.

No memoir, on subjects of physical science, to be accepted for publication, which does not form a positive addition to human knowledge, and all unverified speculation to be rejected.

Each memoir presented to the institution, to be submitted for examination to a commission of persons of reputation for learning in the branch to which the article pertains, and to be accepted for publication, only in case the report of the commission is favorable.

The report on the progress of knowledge, to be furnished by collaborators, consisting of men eminent in the different branches of knowledge. These reports to consist of three classes—physical, moral and political, literature and the fine arts.

One-half of the income of the institution is to be devoted to carrying out this plan; the other half to the increase and diffusion of knowledge, by means of collections of books and objects of nature and art.

The building, which is slowly in progress, is to be erected, in considerable part, out of the interest which will accrue upon the interest, accumulated upon the original sum since it has been in keeping of the United States.

#### Metals and Ores of America.

We find the following brief statement in the *American Mining Journal* of 27th October.

At the last meeting of the Association of American Geologists and Naturalists, Dr. T. C. Jackson, the president of the society, in an essay on the subject, explained the state in which the metals and ores of America are found:

**Gold**, nearly pure. The author explained the different methods of washing and separating the metal in the United States and Brazil, and that the greatest gold deposit in the world is in the eastern slope of the Oural mountains.

**Silver**, in the pure or native state, is found in many places, but more generally in combination, as with copper, lead, zinc, etc. Native silver and native copper are occasionally found in the same specimen. Such is the case with the metals as they occur in the Lake Superior copper.

**Native copper** occurs in the igneous rocks, as the basalt, the greenstone, amygdaloid, etc.

**Tin** has not yet been found in quantities which justify the attempt at working it in the United States. The only known localities are in New Hampshire.

**Lead**, as an ore, is next in value to copper. It is generally found in combination with sulphur, constituting the galena, or sulphuret of lead. In the western States the lead is nearly a pure sulphuret, but often contains a little silver, sometimes amounting to one-half per cent. Five to seven pounds of silver have occasionally been obtained from a ton of lead ore.

#### Buffalo and Mississippi Railroad.

Continued from page 710.

#### GRADES.

In Ohio, we have no data to show what the individual grades would be; the records of Mr. Hopkins' survey having been burnt at the time the warehouse of Mr. Richard Mott, in Toledo, was destroyed by fire. Mr. Hopkins alludes to them in his report, as follows: "From the profile and the accompanying table of grades, you will perceive the grades are very variable, but are generally light, not exceeding the ratio of 32 feet per mile, except in three cases, two of which I concluded to change from 40 to 32 feet per mile, and made my estimate accordingly. The other which occurs between the starting point in Toledo, and the crossing of the Wabash and Erie Canal cannot be materially altered, on account of the elevation necessary to carry the road over the Canal."

The length of the grade last mentioned in this quotation, extending from the commencement of the line in the city to the canal, I assume to be four-tenths of a mile, and the inclination cannot be reduced, without incurring considerable extra cost, in laying the line near Swan Creek, perhaps crossing it and passing over the Canal between Lock No. 3, and the Aqueduct over the Creek.

At the Ohio and Indiana line, the elevation of the road will be 394 feet above Lake Michigan, and about 407 feet above Lake Erie, calling the difference of level between the Lakes 13 feet. Assuming the point of departure in Toledo, to be 9 feet above Lake Erie, and the ascent of the first grade thence to the commencement of the flat country, which extends westward to the St. Joseph's, to be at the rate of 40 feet per mile for a distance of six-tenths of a mile, we get 33 feet to be deducted from the 407 feet, leaving 374 feet to be overcome by grades ascending west, in a distance of little less than 66 miles, to unite the Ohio survey with that of Indiana. Should the grade, where the road would cross the St. Joseph's, be 200 feet above Lake Erie, and the ascent over the flat country uniform; the rate of inclination, would be for this part, about 3 feet per mile: leaving 11 miles, requiring an average grade of nearly 16 feet to the mile, between the St. Joseph's and the junction with the Indiana portion of the road.

In Indiana we have the grades given in the reports, from the Ohio line to the point of divergence 12 miles west of Michigan City, all of which have been arranged anew in the following table of grades and distances, making a few slight alterations, which seemed to be required, as corrections; and to make the table accord more nearly with the profiles.

The table is made continuous from Toledo to Chicago by way of Bristol, or northern route; instead of the southern route through Goshen, a table of which follows the main table; that is, the columns of distances, lengths of grades, and amounts of ascents and descents, are made continuous by the Bristol route, westward from Elkhart village, instead of that by way of Goshen. It

will be seen that both routes are continuous as far as Elkhart village, where owing to the difference in the footings, only one of the routes could be made continuous thence to Chicago, without the insertion of the same matter in the report a second time. The part of the table west of Elkhart village, *per se*, is common to both routes, and nothing in this part is affected by taking one in preference to the other, except the footings; and it is easy to change them, to apply to the Goshen route, if there should be occasion, by adding or deducting the difference found in the footings of the two routes at Elkhart village. By the comparison of these footings at the village, we are enabled to appreciate the advantages or disadvantages of either line over the other, in respect to the several items of distance, length of grades, and amounts of ascents and descents.

By the table we see that the maximum grade in Indiana will be 44.16 feet per mile, with the exception of the steep grades, on the 9th division, between Laporte and Michigan City, where we have a maximum grade of 73.45 feet per mile. On the locomotive stages, where the former grade and those approximating to it occur, engines of extra power should be provided for propelling what would be an economical load for the common engines over the more level parts of the road. On the 9th division, the heavy trains arriving at Michigan City from Chicago, must be broken up, and the parts severally conveyed by single engines to Laporte, where new trains could be made up, adapted to the grades and engines, thence to Toledo. Unless the trains are broken up at Michigan City, an assistant engine will be required at the steep grades on the 9th division, which fortunately are in contiguity, and could all be tended by one engine. The latter method of overcoming these steep grades, would be the more economical as the transit increased.

The grades beyond the diverging point 12 miles west of Michigan City, to Chicago; cannot exceed a moderate rate of inclination, and may for our present purpose be considered as a dead level.

The aggregate lengths of the ascending, descending and level grades, from the Ohio and Indiana line, west to Chicago, are shown at the foot of the table, and are as follows:—

Aggregate length of Level Grade.....	50.10 Miles.
" " Grade ascending west.....	39.10 "
" " Grade descending west.....	81.08 "
	170.28 "

#### Classing and tabulating the grades we have;

	Miles
For Grades under 5 feet per mile ascending west.....	7.92 .....
For Grades under 5 feet per mile descending west.....	28.51 .....
For grades between 5 and 10 feet per mile ascending west.....	25.53 .....
For Grades between 5 and 10 feet per mile descending west.....	24.62 .....
For Grades between 10 and 20 feet per mile ascending west.....	13.88 .....
For Grades between 10 and 20 feet per mile descending west.....	16.23 .....
For Grades between 20 and 30 feet ascending west.....	9.97 .....

For Grades at 44.16 feet descending west.....	2.09
For Grades at 45.38 feet descending west.....	0.15
For Grades at 48.00 feet ascending west.....	0.61
For Grades at 73.45 feet descending west.....	2.31

Total miles of ascent in Indiana,.....39 10  
And descent,.....81.08

## CURVES.

The amount of curvature, within the State of Ohio, was not mentioned in Mr. Hopkins' Report, he only alluded to the very small quantity required, considering the total length of the line; and that there would be none with a radius less than 3000 feet.

In Indiana, the Engineers have reported the quantity of curvature and straight line.

Tabulating the result of the above table, we obtain as below, the aggregate length of curvature in Indiana, expressed both in miles and degrees; giving the curvature, as stated in the reports, for the south route west of Michigan City, instead of the Lake route to Chicago, where the curvature has not been ascertained by any survey.

Radius,	Degrees of Curvature,	Miles.
500 feet there will be	90.75	equal to 0.15
1637 "	36.96	" 0.20
2465 "	1332.57	" 12.62
3820 }	"	"
3319 }	209.08	" 2.64
5729 "	323.69	" 6.13
Straight Line	"	133.77

Total degrees of curve 1993.05 tot'l dist. of 155.51

## ADVANTAGES OF THE LINE AND ITS TRAFFIC.

In considering these subjects, it is important that a correct and satisfactory exposition should be made, to give confidence that the road would pay at the outset; and that afterwards there would be no danger of its being drawn off through other channels.

To guard against the latter occurrence, I would propose that the road should be built with extra stability, and be furnished with locomotives capable of running at high velocities. This course would do much in discouraging the opening of any other line of communication, which would directly interfere with the legitimate business of the road.

It is believed, that the road as surveyed, is as short as any practicable line, with grades as favorable, which can be found passing across the neck of the peninsula of Michigan, from the western extremity of Lake Erie to the south-east bend of Lake Michigan. Any other course north of the one adopted, I have understood would pass over a more elevated country; and would, unless terminated at the same points, be attended by the want of convenient and ample harbors at its termini.

Toledo has the natural advantage of being located at the most westerly point of Lake Erie on Maumee River, at the head of Maumee Bay, easily approached by vessels drawing above 9 feet of water. Its position is

such, that vessels coming up the Canada side of the Lake, when at point Pelee, allowing they could cross the long sand spit which projects some six or eight miles into the Lake, would be at the same distance from Toledo that they would be from Detroit. If they came up the middle of the Lake to Middle Island, they would be 8 miles nearer Toledo than to Detroit; and should they coast the south shore of the lake, would be at Sandusky Point 13 to 16 miles nearer Toledo than Detroit, (using Farmer's map of Michigan for the distances.) I suppose the greater number, nearly all the steamers, pass by the latter route, for the purpose of stopping at the numerous artificial harbors, scattered along this shore, to leave and take in passengers and freights; or in case of storms to obtain a shelter; consequently the majority of the boats could make Toledo at from 25 to 30 dollars less cost than they could Detroit, and save in time 2 hours. This saving of time and exposure on the Lake, would deter many from taking the Detroit and Central Railroad route, who were bound for Chicago.

At Toledo there are two Railroads, one in operation, the other projected and partly executed, they leave in opposite directions; the Erie & Kalamazoo, the one in operation, extends in a north west direction towards the interior of Michigan as far as Adrian, 33 miles from Toledo, where it meets the Southern Railroad, now open from Monroe to Hillsdale, 68 miles in length. The Erie & Kalamazoo Railroad turns into Toledo, annually, a large quantity of wheat and other produce. In 1841, this road drew from Michigan produce to the amount of \$530,000; of which, there were 127,000 bushels of wheat valued at \$120,000; and 45,748 barrels of flour valued at \$228,920.

The other Railroad, 31 miles long, leaves Toledo in the direction of Lower Sandusky, and is a part of the Ohio Railroad. This part was begun a few years ago and afterwards abandoned. Recently it has been purchased by ..... in behalf of a new company, who intend, I understand, to complete it without delay. At Lower Sandusky, it will connect with another portion of the Ohio Railroad, to be laid out to Sandusky City, and also with a short link to be inserted, connecting it with the Mad River Railroad at Tiffin.

The two divisions of the Ohio Railroad from Lower Sandusky to Sandusky City and from thence to Cleveland, where at the same time purchased by other individuals, and it is supposed both parts will be immediately undertaken.

These Railroads completed to Cleveland, it would not be long before they would be extended and united to the New York and Erie Railroad at Dunkirk, should that road terminate at that point. From thence they would be continued to Buffalo and unite with the line of Railroads to Albany and Boston; completing, in one grand trunk, a road 1197 miles long.

The statement below, shows in comparison the lengths and the assumed practicable

time of passage, of the principal Railroad and Steamboat Lines, contemplated or in operation between Galena in Illinois, and Boston and New York.

## Comparative lengths and times of passage of Railroad and steamboat lines from—

	Miles.	Hours.
Galena to N. York, via New York and Erie Railroad.....	1100	52
Galena to Boston, by Railroad.....	1197	56
Galena to Boston, via Welland Canal and Ogdensburg Railroad.....	1278	97
Galena to Boston, via Upper Lakes and Buffalo and Albany Railroad.....	1572	133
Galena to Boston, via Michigan Railroad and Lake Erie.....	1005	76
Galena to New York, via Upper Lakes and New York and Erie Railroad.....	1484	127
Galena to Boston, via Upper Lakes and Welland Canal.....	1662	161

Lake Erie opens at Cleveland 32 days earlier on the average of 9 years, than it does at Buffalo; and much earlier than it does at Dunkirk. The Welland Canal also is generally acknowledged to be navigable two or three weeks sooner than the Erie Canal, and about as much sooner than the opening of the navigation at Buffalo and Dunkirk; these facts make it quite certain, that large quantities of wheat, flour and other products of the west, will be forwarded over the railroads and through the Welland Canal, to Lower Canada and the sea-board in the spring and fall of the year.

The Wabash and Erie Canal unites with Lake Erie at Toledo, and runs 87 miles to the eastern boundary of Indiana, thence through Indiana, via Fort Wayne, Logansport, and Terre Haute to Evansville, on the Ohio River.

The Miami Canal, in Ohio, connects with the Wabash and Erie, at a point about 68 miles from Toledo, and terminates at Cincinnati. These canals are now completed within the State of Ohio, and that part of the Wabash and Erie Canal, not finished, within the State of Indiana, will soon be opened under the arrangements made last winter, between the State and the Foreign Bond holders.

From Laporte, under the conditional supplementary charter, granted to the company last winter, it is proposed to run a railroad to Lafayette, on the Wabash and Erie Canal, a distance of about 85 miles; thence to be continued to the Illinois line in the direction of St. Louis, a further distance of about 40 miles, where it would probably join the projected Northern Cross Railroad, passing through Illinois, from Danville via Springfield to Quincy, on the Mississippi River, intersecting the projected great Central Railroad, at Decatur. I have understood from good authority that a number of miles of this Northern Cross Railroad was under contract during the last year.

At the Illinois line, the road would be within the limits of the great coal field of Illinois, and in the vicinity of valuable beds of iron ore and sandstone, the latter suitable for grindstones and for architectural purposes. The ore is found in Vermillion county, Indiana. The sandstone in Warren county; and borings for salt have been made

with success in Fountain county, Indiana, and near Danville in Illinois.

It is said, the country from Laporte to Lafayette is a dead flat, and that the Railroad could be made straight: the country, however, I understand, is new, and would not in its present condition furnish much traffic, being thinly settled, consequently the road must on its being opened, depend chiefly for its support, on the through business that would come from the central and lower portions of Illinois and Indiana.

At Lafayette the line would soon be joined by the Madison and Lafayette Railroad, leading from Lafayette through Indianapolis to Madison on the Ohio River, 92 miles below Cincinnati, and 417 miles above the mouth of the Ohio, this road has been commenced, and is about to be opened from Madison to Indianapolis, 50 miles being in use; the other portion from Indianapolis to Lafayette is only a projected road, but is greatly wanted for the accommodation of the numerous emigrants who traverse this part of the country, on their way towards Lake Michigan and surrounding states; for the common roads here are of the most ordinary description; at least, such I found to be the great thoroughfare from Logansport to Indianapolis on my return to the east from Michigan City, the last winter.

It is the prospective value of the line to Lafayette, or some other in a direction more westerly, in conjunction with the important local business that attaches itself to Laporte, that forbids an attempt to mend the main line here, by cutting off the obtuse angle made by laying the road through Laporte in its course to Michigan City.

Michigan City must become a very important station on the line, because of its harbor and position at the south-eastern bend of the Lake; well calculated for a point of departure for such passengers and freight as are destined for the several ports in Wisconsin Territory, and possibly for a line of communication to the northern extremity of Green Bay, and over the country to the south shore of Lake Superior. The distance from the City across the Lake to Milwaukee, is but 7 or 8 miles further than it is from St. Joseph. And taking into consideration the extra length of the Central Railroad (202 miles) over that from Toledo to Michigan City, (186 miles) passengers can be carried cheaper to Milwaukee from Toledo, than they can from Detroit, the difference in the total distance being 8 or 9 miles in favor of the city route.

It would appear, from the information I gathered while at Michigan City, that the position of that place was more favorable for the construction of a permanent and safe harbor, than any other site at the head of the Lake; for the reason that the sand and shingle composing the beach, had but little tendency to move one way more than the other; the action of the waves, during the prevailing strong winds, being nearly perpendicular to the shore, would cause an equality of action on the beach, which would not have place on either side of the Lake.

On the sides, these sweeping winds cause an accumulation of sand and shingle on the northern side of the long jetties constructed at the harbors; and in a few years these works of art are overreached by the accumulation, and a further extension demanded to keep the harbors open. It is this balance of forces at Michigan City which Major Bowes, of the U. S. Topographical Engineers, who has charge of the government works here, assured me was greatly in favor of establishing one of the most stationary harbors at this end of the Lake.

The General Government commenced operations here in the form of surveys and estimates, about the year 1835, when an appropriation of \$20,000 was granted. In 1836, Lieut. T. B. W. Stockton estimated the amount of money required to complete the harbor, at \$150,000. The appropriation for the harbor improvement, as recommended, was for the present year, \$40,000—more, I think, than was proposed for any other single harbor on this Lake.

In the winter season, the travel and business from the State of Michigan, destined for northern Illinois, Wisconsin and Iowa, would naturally be concentrated here, and contribute at the outset in no ordinary degree, to the business of the road hence to Chicago (50 miles). This travel would annually increase, at least, in the ratio of the increase of the population of Michigan, aided, moreover, by the annual increase of the population of Upper Canada.

Should the city be avoided by a portion of the Michigan travel, the road would necessarily intercept it somewhere west of Toledo, and increase the receipts according to the extra distance it would pass on the road. That portion of the travel bound for the middle and southern portions of Indiana and Illinois, would pass on the main road to Laporte, where it would take the Lafayette branch; provided there was no other branch leading from the main stem, to divert it into other channels: a case which cannot occur without the consent of the corporation for a period of 15 years, if the late supplementary act is accepted by the company.

The geographical position of Chicago for a city, has from its origin been set down as auspicious, with rich prairies extending to the south-west, west, and north west across the country to the Mississippi River; important as a point where many long lines of intercommunication must unavoidably converge, coming in from all points of the compass, bearing the rich products of Forests, Mines and Agriculture; and it is quite apparent at the present time, that what was prognosticated at its birth, is actually taking place. We have here the termination of the great Illinois and Michigan Canal, projected upwards of twenty years ago, but now on the eve of completion: this Canal is one of the largest class, and extends 95½ or 100 miles to the head of steamboat navigation on the Illinois River: it opens a water communication 1700 miles to the Gulf of Mexico, and completes an inland navigation of 3200 miles to the Gulf of St. Lawrence, by way

of the Lakes, Canada Canals, and St. Lawrence River; and by way of the Lakes, the Erie Canal and Hudson River, to the City of New York, a distance of 3100 miles.

We have also, at Chicago, the projected Galena and Chicago Union Railroad, which is in effect but a continuation of the Buffalo and Mississippi Railroad, extending to Galena. The charter is broad in its terms, and will by the influence of the citizens of Chicago, be soon carried into effect, if operations have not been already arranged. Under a clause in the charter, permitting lateral lines to be built, it is conceded, that that part of our line which lies in Illinois, and which for the sake of simplicity has been considered as a part of the Buffalo and Mississippi Railroad, would be built. The charter to the company, grants the privilege of connecting the road with the Central Railroad in its course to Galena, should they prefer it, to a more direct route. The distance by the direct route would be 160 miles, supposing it no greater than the present stage route. If it diverges to the Central Railroad, passing by way of Dixonville, on Rock River, the distance from Chicago to Galena would be 170 miles—supposing as before, the line to be of the length of the stage road. The charter allows a capital of \$2,000,000.

The appropriations by Government for improving the harbor of Chicago, have been great, and further extensive improvements, I am informed, are contemplated. Some of the early appropriations were as follows: in 1833 \$25,000; in 1834 \$32,801; in 1835 \$32,800; and in 1836 \$68,350 was demanded by the estimates, for completing the work agreeably to a plan proposed at that time, which, if carried out, would have made the cost of the work \$205,561. In 1837, a further appropriation of \$40,000 was granted; and in January, 1838, it was stated, all the appropriations amounted, up to that time, to \$162,601.

I have added the following table of distances, counted from Chicago, to show in comparison the lengths of the various lines of communication projected or in operation, passing to or from the city. It is not to be supposed, that the distances will in every case be found exact; many of them, when no satisfactory information could be found elsewhere, have been ascertained by measurements made on maps, calling 69.45 miles the length of a degree of latitude in the neighborhood of the Lakes. For instance, the distance from Chicago to Buffalo by way of the Lakes, was ascertained in this way, by measuring the route on Mitchell's great map of the United States, published in 1834.

The routes in some instances are made to retrograde for the purpose of completing circuits, and to allow distances to be ascertained in opposite directions at any point in a circuit.

The table next following that of the distances, contains the General Statistics along the Railroad Line, from Chicago to the Ohio Line, and will be referred to as occasion requires.

To be Continued.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.**  
Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.  
Hamilton, July 30, 1847. 2m33

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

#### PASCAL IRON WORKS.

#### WELDED WROUGHT IRON TUBES

From 4 inches to 1 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to  
**FULLER & BROWN, Agents.**

No. 139 Greenwich, corner of Cedar street.  
June 1, 1847. 10lf

**PENNSYLVANIA RAILROAD COMPANY**  
Notice to Contractors.—Proposals will be received until FRIDAY, the 26th day of November, at 10 o'clock A. M., at the Town Hall, in the Borough of Lewistown, for the grading and masonry upon about 40 miles of the Pennsylvania Railroad, extending west from section 20 to near Lewistown.

Plans and specifications of the work can be seen at the above named place for five days previous to the time appointed for receiving bids.

Any further information can be had upon application to **WM. B. FOSTER, Jr., Esq.,** Associate Engineer at Harrisburg. **S. V. MERRICK,** 344 President.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

**PASSENGERS, SPECIE, GOODS, PARCELS, etc.**  
To all parts of the United States, North and South America, West Indies, India, (overland or otherwise,) Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m **ROBERT GRACIE.**

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address  
**SAM'L KIMBER & CO.,**  
Willow Street Wharf,  
Philadelphia, Pa.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

••• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

#### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by  
**JOHN A. ROEBLING, Civil Engineer,**  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

92v11v

#### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

**R. L. Stevens,** President Camden and Amboy Railroad Company; **Richard Peters,** Superintendent Georgia Railroad, Augusta, Ga.; **G. A. Nicolls,** Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; **W. E. Morris,** President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; **E. B. Dudley,** President W. and R. Railroad Company, Wilmington, N. C.; **Col. James Gadaden,** President S. C. and C. Railroad Company, Charleston, S. C.; **W. C. Walker,** Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; **R. S. Van Rensselaer,** Engineer and Sup't Hartford and New Haven Railroad; **W. R. M'Kee,** Sup't Lexington and Ohio Railroad, Lexington, Ky.; **T. L. Smith,** Sup't New Jersey Railroad Trans. Co.; **J. Elliott,** Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; **J. O. Sterns,** Sup't Elizabethtown and Somerville Railroad; **R. R. Cuyler,** President Central Railroad Company, Savannah, Ga.; **J. D. Gray,** Sup't Macon Railroad, Macon, Ga.; **J. H. Cleveland,** Sup't Southern Railroad, Monroe, Mich.; **M. F. Chittenden,** Sup't M. P. Central Railroad, Detroit, Mich.; **G. B. Fisk,** President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hineckly & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Etting, Philadelphia; Wm. E. Coffin & Co Boston. ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

#### Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callen-lers; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size, Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2 1/2 feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 21
13,000 Spikes = 2,250 lbs. at 44 cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 351

## LAP-WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1/4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address

J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

road Depots, etc.

West Troy, May 12, 1847.

ANDREW MENEELY.

1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollow ware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight paper barrels, by JOHN W. LAWRENCE,

142 Front street, New York.

Orders for the above will be received and promptly attended to at this office.

32 17

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1v24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

1y25

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.] JOHN LEACH,

Jamaica November 12, 1845.

**THE SUBSCRIBERS, AGENTS FOR**

the sale of  
Codorus,  
Glendon,  
Spring M.I. and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L. KIMBER, & CO.,**

59 North Wharves,

Jan. 14, 1846. [1y4] Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**  
p45 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MACHINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

25,000 to 30,000 made weekly. 35

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gear of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY**, a45 President of the Newcastle Manuf. Co.

**RAILROAD IRON AND LOCOMOTIVE** Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia, 25th

**LAP-WELDED WROUGHT IRON TUBES** for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

**IRVING VAN WART**,  
12 Platt street, New York.  
**JOB CUTLER**, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 28th

**SPRING STEEL FOR LOCOMOTIVES.** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

**JOAN F. WINSLOW, Agent**,  
Albany Iron and Nail Works, 1y

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

**REEVES, BUCK & CO.**,  
Philadelphia.  
**ROBERT NICHOLS**, Agent,  
No. 79 Water St., New York. 26th

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly *indestructible*. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28th

J. BALL &amp; CO.

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m. on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**PATERSON RAILROAD** Summer Arrangement. Commencing April 20th, 1847, the cars will leave Paterson at New York at  
8 o'clock a.m. 9½ o'clock a.m.  
11½ o'clock a.m. 12 1-4 o'clock p.m.  
4 o'clock p.m. 5½ o'clock p.m.  
On Sunday.  
8 o'clock a.m. 9½ o'clock a.m.  
4 o'clock p.m. 5½ o'clock p.m.  
Office 75 Courtlandt St.

**BALTIMORE AND OHIO RAILROAD.**

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12½ night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13½

**LITTLE MIAMI RAILROAD COMPANY.**

Fall and Winter Arrangement, 1847. On and after Monday, September 20th, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Yellow Springs, and Springfield. Returning, will leave Springfield at 4½ a.m. Upward train arrives at Cincinnati at 2½ p.m. Downward train arrives at Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore & Co. are running the following stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheeling, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanesville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine & the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, in 32 hours. Distance from Cincinnati to Springfield by railroad.....84 miles.

From Springfield to Bellefontaine by stage, over a good Summer road.....33 "

From Bellefontaine to Sandusky city by railroad.....103 "

**Fare**—From Cincinnati to Lebanon.....\$1 00  
 " " " Xenia.....1 50  
 " " " Springfield... 2 00  
 " " " Columbus... 4 00  
 " " " Sandusky city 7 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Denison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at a passage for every \$500 in value over that amount.

47d W. H. CLEMENT, Sup't.

**BALTIMORE AND SUSQUEHANNA**

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston, on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50  
 Fare through from Charleston to Huntsville, Decatur and Tuscumbia..... 22 00  
 The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr. Agent.

THE WESTERN AND ATLANTIC

Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAIL**

road line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
 Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
 Second class cars..... 3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1½ p.m.

The lines for Baltimore leave Philadelphia daily except Sundays, at 8 a.m., 3½ and 10 p.m., and Saturdays only at 10 p.m.—being a continuation of the line from New York. 25W

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

A Passenger Train will leave Philadelphia and Pottsville daily, except Sundays, at 9 o'clock A. M.

The Train from Philadelphia arrives at Reading at 12 18 M.

The Train from Pottsville arrives at Reading at 10 43 A. M.

Fares.	Miles.	No. 1.	No. 2.
Between Phila. and Pottsville, 92		\$3.50 and	\$3.00

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, November 20, 1847.

### To Contractors—Pennsylvania Central Railroad.

It will be seen, on referring to the advertisement of this company, that the amount of work to be let has been increased by several miles since the notice was first given—and that the day of letting has been changed from Thursday the 25th, to Friday the 26th of November. We would, therefore, ask the attention of our readers engaged in that line, to the notice of the company, which we bring forward in this number for their convenience.

**PENNSYLVANIA RAILROAD COMPANY**  
Notice to Contractors.—Proposals will be received until FRIDAY, the 26th day of November, at 10 o'clock A. M., at the Town Hall, in the Borough of Lewistown, for the grading and masonry upon about 40 miles of the Pennsylvania Railroad, extending west from section 20 to near Lewis-town.

Plans and specifications of the work can be seen at the above named place for five days previous to the time appointed for receiving bids.

Any further information can be had upon application to WM. B. FOSTER, Jr., Esq., Associate Engineer at Harrisburg. S. V. MERRICK, 344 President.

### Schuylkill Coal Trade.

SCHUYLKILL NAVIGATION.—Week ending November 11, 1847.

Previously.....	203,283 00
Total.....	211,895 06

### Mount Savage Iron Works.

These extensive iron works were sold, we perceive, at the time appointed, last week, to Messrs. Corning & Winslow of Albany, and Mr. J. M. Forbes of Boston, for \$215,000, upon the judgments of the English bond holders. This establishment, like many other pioneers in this country, commenced operations upon too large a scale at first, requiring an immense outlay of capital to be a long time out of use before returns could be realized, and probably mainly upon a borrowed, instead of a subscribed and paid-up capital.

We are not informed as to the extent of the works at this time, but understand that they have been much enlarged since our visit to them in 1843, the year they commenced making railroad iron. The outlay of capital has been more than twice, and probably three times as much as the amount of this sale, which ought to be, and will be under the management of the present proprietors—who are practical business men—an excellent investment.

We understand that operations will be recommenced at an early day; and we hope to hear that our anticipations of this establishment are yet to be fully realized.

### Central Michigan Railroad.

Receipts for October.

The Central railroad company, says the Detroit Free Press, are doing a large business on the road. The receipts for the month of October were \$60,300 96. Considering the running expenses, length of road, etc., we venture to say there is not in the United States, a road which pays as well to the stockholders.

"When this road is finished through to the lake, it will do a business that will astonish our eastern neighbors, who have until recently imagined this road an unprofitable investment. In the spring of 1846, we were in New York city, and heard an intelligent gentleman express surprise that capitalists could be found willing to invest money in a railroad 'away out west,' and assert that the country could not give support enough to the road to pay interest on the investment. We were appealed to, to know how much the daily or monthly receipts were, and remarked that the road had done a business of \$30,000 per month, and that one year would see it doing a business of \$50,000 per month. This was not believed. Now, we see the road doing a \$60,000 business per month, or \$2,000 per day, and this, too, during lake navigation, when every upper lake boat

is running opposition to the road. 'This is a great country,' and is constantly growing."

### Northern N. H. Railroad.

"We understand," says the Boston Atlas of the 13th, "that this railroad will be opened entirely (with the exception of a short piece from Lebanon village to the Connecticut river, which it is unnecessary to run, until the roads in Vermont are complete) to the public, on Wednesday, the 17th instant. On that day, the stockholders, with invited guests, will pass over the road, leaving Boston in a special train, at 7 A. M., and returning the next day—dining together, by invitation of the citizens of Lebanon and vicinity, on the 17th. Among the invited guests who have consented to be present, we learn, are the Hon. DANIEL WEBSTER, Hon. JOSIAH QUINCY, Jr., Hon. CHARLES H. WARREN, Hon. JOSEPH BELL, and numerous others. We understand a grand gathering is anticipated at Lebanon, to celebrate the completion of this enterprise, connecting by railroad the valleys of the Connecticut and Merrimac—and, for the first time, opening railroad facilities to the Vermont state line.

This line of road now extends from Boston to Lowell, thence up the manufacturing valley of the Merrimac, through Manchester, Nashua, Concord and Franklin, where it leaves the valley, and crosses over the intervening heights, at a moderate grade, to the valleys of the Blackwater and Smith's rivers, and thence follows the Mascota river down to the Connecticut, where intersecting roads connect with it, and extend, in one direction up the valley of the Connecticut and Passumpsic rivers, to Stanstead and Montreal; and, in the other, through Central Vermont, to Burlington, St. John's and Montreal, and to Pittsburg and the Saint Lawrence, at Ogdensburg.

The distance from Boston to Connecticut river, by this line, is 142 miles, which is now to be opened to the public. Of this, the Northern road makes about 69; and the Concord, Nashua and Lowell, and Boston and Lowell, 73 miles.

Forty-four miles of this road have been run, namely, from Concord to Grafton, since Sept. 1st, and the receipts upon it have been large. The gross receipts for freight alone, for last month, exceeded \$4000 per week. The remaining twenty-five miles are now to be added, and the receipts will be greatly increased. The passenger receipts have also been large—equalling, if not exceeding, expectation.

These facts seem fully to justify the standing the stock of this road has always maintained in our share market; and we confidently hope its stockholders may realize all they indicate."

There has been uncommon energy, and good management in the construction of this road; and those who have invested their capital in it will be sure to derive ample returns, as it will unquestionably prove one of the most profitable roads in New England.—[Ed. R. R. J.]

#### Railroad Fares—Comparative Rates in the United States.

The comparative rates of fare on railroads is a subject of some interest, we have therefore prepared the following tabular statement of the principal railroads in the United States, giving their length, through fare, and rates per mile, from which it will be seen that the New York and Erie railroad charges the lowest rate, viz: 1-72 cents per mile—the Harlem next, and then the Long Island railroad. The New England roads all range below three cents, except the New Haven, Hartford and Springfield, which is one-tenth over. And the next lowest, after the New England roads, is the Weldon and Wilmington, N. C., which is a fraction less than 2 1/2 cents—quite too low for a country so thinly populated—though high enough for many of the more northern lines.

From this statement it will be seen that the railroads in the the State of New York, diverging from the city of New York, charge lower rates than any other roads in the country; and we presume the managers of those roads have been influenced by the belief that, where there is a dense, and to a certain extent confined population, the true plan is to put the rates of fare low, and thus induce the masses to use the road. This we are fully convinced is the true policy, and we believe it will ultimately prevail.

In the case of the continental railways, the first three classes of expenses have not been so great. The "law charges," etc., on the Belgian, were £430 a mile; on the Paris and Rouen, £800. The "land and compensation," Paris and Rouen, £2300; Belgian, £2750. In "railway works and stations," Belgian, £10,600 per mile; Paris and Rouen, £17,000. In the "carrying establishments," Belgian, £2450; and Paris and Rouen, £3400 per mile.—*The Rail, its Origin and Prospects.*

#### Great Western Canada Railroad.

On Saturday, the 23d of October, this company broke ground, with appropriate ceremony, at London. There appears to have been much enthusiasm manifested by the people of that district—and the day was made a day of rejoicing and amusement.

The charter for this road was obtained about ten years ago. The government appropriated £200,000 in aid of the work, but from the general depression in the business operations of 1838 and 1839, with other difficulties of a local character, prevented the commencement of the work. It was considered a work of too great importance, however, to remain long neglected, and another effort was made in 1844 and 1845 to get the stock taken in England, which was thought for a time to be entirely successful; but, to use the language of the president of the company, Sir Allan McNab, "scarcely was the arrangement effected when the railroad panic broke out in England, and the stockholders were in consequence unable to fulfill their engagements. They had, however, he was happy to say, £250,000 of stock held in England, by good constituents—men who are able and willing to pay, and who have paid five per cent. or £12,500 on their shares." Yet, notwithstanding all the difficulties and the delays which have taken place, he said, "in conclusion, he would assure them that, come what may, it was a positive certainty that the road would be built, and that, too, with very little delay. No government could stand which

would not support this railway, and he had no hesitation in saying *they must support it!*"

After years of delay and years of effort, and of preliminary surveys, the surveys for a definite location were commenced early last spring, under the direction of CHARLES B. STUART, Esq., one of the most persevering and efficient engineers of the United States, aided by several other young men of the profession from the States, and pursued with a vigor—and we think we may say a success, rarely equaled, as they examined and "carefully surveyed nearly fifteen hundred miles" of line—and located definitely, including the branch to Sarnia, 277½ miles, of which 264 miles are straight lines—as may be seen in Mr. Stuart's report, published, with a very valuable map, showing the line and all its important connections, both east and west, as well as in Canada, in the Journal of September 18th, or No. 38.—Since the surveys were completed, one hundred and ninety-two miles, extending from Niagara river to Hamilton, thence to London and thence to Port Sarnia on the St. Clair river, have been put under contract; considerably, as we understand, within the estimate of the engineer; and now we perceive that the work has been formally commenced, and under auspices, we trust, which will ensure its rapid construction, as we are quite sure that it will prove to be one of the best investments of capital in the country.

In the course of the proceedings, Geo. S. Tiffany, Esq., chairman of the directors, addressed the meeting, explanatory of the great and peculiar advantages of this road, not only as a local work, but as the great and direct connecting link between the roads of Michigan, Indiana and Illinois to the Mississippi and Ohio rivers, and those of New York and New England. The remarks of Mr. Tiffany are so appropriate that we give the following extracts from them, as published in the Toronto Globe of 27th October, and refer our readers to the map accompanying Mr. Stuart's report in No. 38 of the Journal, from which they will better understand the subject, and appreciate the importance of this line.

Mr. Tiffany said "he was called on to speak of the tendency which the Great Western road would have in promoting friendly relations between this province and the United States, and he believed there was no one present who did not feel the vast importance to both countries, to cultivate and maintain mutual good will. Through the means of the great and increasing commercial interest between this province and the United States—which he hoped would soon open out our trade in all agricultural products, through the facilities which our canals and railroads will afford—we feel no doubt that both interest and the inclination of the people of both countries, will be to strengthen the bond of good feeling, and will effectually prevent the growth of those prejudices and animosities which so often have arisen among people living under different governments. The Great Western was so located as not only to perform the office of forwarding the commercial communications between this province and the United States, but it is calculated by its position to afford the best route of communication between the eastern and western States. It is the necessary intermediate and connecting link between the chain of railroad from Boston to Niagara river, and the railroad from Detroit to Lake Michigan, to be continued thence round the head of the lake to Chicago and the Mississippi river. A glance at the geographical position of this province and the adjoining States will convince any one of the advantages possessed by the Great Western, in commanding a large portion of the business and travelling between those countries."

He then alluded to the astonishing growth and extent of the business now done on Lake Erie.

"Viewing the road, therefore, as so necessary to the people of the United States, he thought it would

be productive of happy effects in showing to us their good will. This had indeed been manifested by the Americans having taken largely in the capital stock of the company. He then alluded to the vast benefits the road would confer on the province, by showing that its route had been wanted from the Niagara to the Detroit river, in nearly a direct line through the oldest and best settled portion of the province, passing through or near all its important towns, thus not disturbing the business of the country, but adding greatly to its facilities, and increasing the size of the towns, and adding much to the value of real estate. Main roads now radiate from the town of London, penetrating in all directions the rich agricultural country which surrounds it. It will soon become the chief mart for the sale of produce, and the depot of merchandise for the supply of the interior; it will soon grow up into a large city.

"The value of the road to the farmer would be incalculable. By it he will be able to avail himself of the best markets throughout the year, not only for the sale of wheat—the great staple—but for the innumerable other articles of agricultural produce which now, for the want of cheap and rapid means of transportation, are comparatively valueless to him. He drew their attention to the events of the past year when, through the want of such a line of road wheat and flour was locked up for a long time at a great loss to the owners, and that at the present moment wheat brought 1s. 3d. per bushel more at Buffalo than at Hamilton. The construction of the Great Western will correct this evil, and place the Canadian farmers on an equal footing with the farmers of western New York. These were strong motives why every man should, according to his ability, aid in building the road, but whatever the public may do in this respect, they might rely on the directors doing their duty, and he expressed his perfect confidence that the road would soon be completed. He then said that the directors had never regarded this road solely as a western measure, but that they had, as long ago as 1838, in their published report, recommended the extension of it to Montreal and Quebec, and from thence to Halifax and St. Andrews. He regretted that government had not seen fit to take up this whole great project, and construct it at the public cost, with the view of promoting the prosperity of the country, and apply its surplus profits hereafter to the support of the general expenses of the government, and thus relieve the people from taxation, or in the construction of other lines to intersect the main trunk.

"He expressed his belief founded on analogy, that the Great Western would pay dividends of 15 per cent. the first year after its completion, and that the line from Hamilton to Quebec would pay 6 per cent. In furtherance of this plan, the directors had procured a line from Hamilton to Montreal, to be chartered the session before last.

"In England and the United States the people had felt the want of a general system of railroads.

"Their roads had been constructed without such a plan by piece-meal, and to meet mere local wants.

"In this country we had, as yet, no railroads; if we except that between La Prairie and St. John's.—For more than 17 years they have been constructing to a great extent in other countries, while we have looked on at a distance; but we have the advantage of the experience of those to guide us, and if we will be but taught by such experience, we may in the end have no reason to regret the delay of making railroads here. We can hardly expect that private capital and enterprise can be found, sufficient to carry out so large a system for many years, and therefore he hoped that while there was yet time, government would, with an enlightened and bold policy, take the matter up.

"He concluded by expressing his gratified surprise at the immense, and highly respectable assemblage of the people on that occasion, and could not but regard it as a hopeful indication of the awakened and deep interest the people feel in the construction of the road."

Charles B. Stuart, Esq., chief engineer of the company, was then introduced to the audience, and he proceeded to give a brief sketch of the progress of the work, and the favorable adaptation of the country for the construction of a railroad. He dwelt at some length, likewise, on "the great advan-

tage which this line would be to Canada, and showed the certainty of a large portion of the passenger and freight transport trade of the great western territories being diverted through it. Mr. Stuart wound up by an energetic appeal to the people of Canada to put their shoulders manfully to the wheel, and the work will soon be carried through."

A public dinner was given by the citizens of London, at the Western Hotel, at which about 120 gentlemen were seated. After toasting her most gracious Majesty—Prince Albert and the royal family—and the Governor General of Canada, which were of course drank with all the honors and many cheers—"the president then rose and said in this great improvement which they sought to effect in Canada, several enterprising Americans were associated;—many of the stockholders and some of the guests of the evening were natives of the United States; the proposed railroad, it was expected, would be largely supported by our neighbors; the commercial affinity of Canada and the States was every day becoming closer—and he thought all present would feel on such an occasion, it was a proper compliment to their friends from the other side, to do honor to their chief magistrate. He gave the *President of the United States*. The toast was drank with all the honors.

"Mr. Stuart replied. He said he had almost forgotten that he was a native of the United States.—He had been but six months in the country, but he had been treated like one at home, and he had felt as if at home, and why should it not be so? They were all living for the same purpose—all were striving for the same end. It was the pride of the United States to follow the example of old England. (cheers.) Where did they first learn the art of making railroads? we were indebted to England for it—there the first iron road was built. And were they not on that very occasion to unite the two countries more closely together, to band them together by bands of iron? The people of the United States were desirous of cultivating an enduring social friendship with the people of Canada—and no part of the country more so than the Empire State of New York.—An American in Canada could hardly realize, now, that the countries were separated—but when the iron bridge spans the mighty Niagara, and we sweep in crowds over your railroad, we will forget that we are foreigners. And when Canadians shall visit our side of the lines we shall hold out to them the right hand of fellowship—and nowhere will they receive a heartier welcome than in the Empire State. I thank you, Mr. President and gentlemen, conceeded Mr. Stuart, for the toast you have received so cordially, and believe me that, when you come to our side of the lines, we will give as hearty cheers for your Queen as you have give for our President. (loud cheers.)"

There were many good things said and songs sung, but nothing perhaps occurred which excited more amusement than the following short reply of the venerable Col. TALBOT, when his health was drank.

The chairman said—after a warm eulogy upon the character of that gentleman—that, "in Colonel Talbot's presence he would refrain from saying more, and he knew that eulogy was not required to call forth a hearty response to 'the health of the Hon. Thomas Talbot.'"

"Loud and long continued cheering greeted this toast, and Mr. Coote Stanley sang, in good style—'The Fine Old English Gentleman.'"

"Col. Talbot then rose and said, I thank you gentlemen most gratefully for the honor you have done

me this day. I have witnessed a scene which I never hoped to behold in this settlement—it is an event never to be forgotten. I believe I am the oldest inhabitant. I slept on this spot 55 years ago, when my best friend was a porcupine. We were often excessively hungry in those days, but we all used to declare that we never were so hungry as the night we ate the porcupine. (Cheers and laughter.) What a change has occurred since then! Now I see different beings around me—no porcupine—no bristles—but in their place a company of half-civilized gentlemen. (Laughter and cheers.) I wish you gentlemen, all prosperity, and when I am laid under the sod, may you go on progressing under the blessing of God, (cheers.)"

To a complimentary toast to the engineers, Mr. Stuart acknowledged his obligations to Mr. Spaulding and his other assistants, to which Mr. Spaulding briefly replied, and gave—"The Ladies," which was enthusiastically received; and the party immediately afterwards broke up.

The demonstration from first to last, went off admirably; and we trust it is a happy presage of the success awaiting the enterprise.

#### Gauge, or Width of Track for Railroads.

There has been much written and said upon the width of track for railroads. The early views of engineers, and others, in relation to the width of track for railroads, were probably no nearer correct under the present state of things, than were those in relation to the weight of rail and weight of engine; yet, unfortunately, the width of track cannot be as easily varied as the weight of engine, or rail, and therefore it is that a deviation from the ordinary rule, or practice of a country, or particular section of country, usually causes a warm contest between the advocates of the different gauges. Such has been the result in England, more especially, since the contest between the Great Western, with Mr. Brunel—who likes to lead—at its head, and the other principal lines in the kingdom.

Of the superiority of a track wider than 4 feet 8½ inches, we have not a doubt; but whether it should be 5 feet, 5 feet 6 inches, 6 feet, or seven feet—the width of the "Great Western"—we do not presume to decide; but that it would have been much better in the end, if a wider gauge had been at first adopted, we think there cannot be a doubt. It has however been, by many able men, deemed doubtful whether true policy, now, after so many roads have been built, and so large an expenditure has been made, dictates a change of gauge. There are circumstances, we are quite satisfied, where a different gauge may be adopted by a company; and perhaps there is no line where it can be, with more propriety adopted than from Portland to Montreal, for the reason that it passes through a country, and opens a communication, where the freight to be transported is likely to be of a bulky character; and also because it is to be the pioneer road for the entire region of country lying east and northward of it; and because it will be as easy for all roads constructed beyond it, which may be in any way connected with it, to adopt its gauge as any other.

Such appears to have been the opinion of the engineer, Mr. A. C. Morton, who has put his views at length in the shape of a report, to the directors of the St. Lawrence and Atlantic, or the Canada portion of the road, which we propose to give in part or in whole to our readers, as we may find room for it.

From this report, as well as from other sources, it will be seen that we now have a variety of gauges in this country—though principally of 4 feet 8½ in., or 4 feet 9 in. The roads in New Jersey, Ohio and

Mississippi, Mr. Morton says, are 4 feet 10 inches. The roads in South Carolina, Georgia and Florida, are 5 feet. The Louisiana roads are 5 feet 6 inches. While the New York and Erie road alone in this country is 6 feet. It is not therefore breaking a rule to deviate from what is, by many supposed to be, a uniform custom, and under the circumstances, where it cannot throw serious obstructions in the way of business, nor interfere with roads now in use, we are quite content with the decision of those interested in the Portland and Montreal road, and commend the arguments of Mr. Morton to the attention of the readers of the Journal, and the profession generally.

#### Report on the Gauge for the St. Lawrence & Atlantic Railroad. By A. C. Morton, Esq., Chief Engineer.

ENGINEER DEPARTMENT, MONTREAL, }  
September 20th, 1847. }

HON. A. N. MORIN, President  
St. Lawrence and Atlantic Railroad Co.:

SIR: The Act to amend the Act incorporating the St. Lawrence and Atlantic railroad company, passed at the late session of the provincial parliament, 10th and 11th Victoria, Cap. 65, provides,

"That the gauge upon which the said rail shall be constructed, and which shall be used in the said railway, shall be four feet eight and one-half inches, unless, within six calendar months, the governor of this province in council, determine upon any different gauge, and that, upon communication to the said company of any order in council, establishing any different gauge, the gauge so established shall be the one used in the said road as if the same had been established in and by this act."

The charter of your road contemplates a connection at the boundary line with another road belonging to an American corporation, the two forming a perfect line to the Atlantic coast.

It therefore became necessary in the early stage of these roads that the subject of the gauge should be jointly considered by the two corporations.

After a careful consideration of the question by a convention of directors from each corporation, articles of agreement were entered into relative to the general plan of construction, etc., dated April 17th, 1846, in which among other things it is provided (article 5th) "that the gauge shall be that of 5 feet 6 inches in the clear between the rails."

As this gauge differs from that embraced in the recent act of parliament, it is proper that I should state the reasons which influenced me in recommending its adoption for your road.

The question of the best gauge for railways has, within a few years, been much discussed, and it is a subject upon which much difference of opinion prevails. The agitation of this question did not, however, take place until railway improvements were far advanced, involving a vast expenditure of money; and it is not surprising that, under these circumstances, there should be a difference of opinion as to the propriety and expediency of a change.

In an abstract view of the subject, I believe engineers generally consider that a

wider gauge than the prevailing one is desirable, to meet the requirements of the present advanced state of railway improvement.

With our present knowledge of railways, were a new system to be commenced free from interest and the prejudices of engineers, committed to a particular width, there can be little doubt but that a different gauge from that of four feet eight and a half inches would be adopted.

This gauge had its origin from no scientific investigation of the subject but from mere accident, it having been in use at a very early date on tram roads, upon which the ordinary wagons of the country ran.

From these it was copied by several coal roads, and afterwards for the Stockton and Darlington, and Liverpool and Manchester railways, which were the first constructed for passengers and general traffic.

This gauge having been adopted for the first important road in England, was copied or extended by branches or other lines without any investigation of its merits till several hundred miles were built.

In the United States the same gauge was usually adopted, and not without very good reason, for it was supposed that the experience already obtained in England, from having first introduced railways generally on this gauge, was sufficient evidence of its possessing all the requisite advantages.

As the first locomotive engines used in the United States were imported from England, it was doubtless considered advisable, both as regards economy and convenience, that they should conform to those already in use in that country, and this may have been a strong reason for adhering to the same gauge.

The Great Western road in England was, I believe, the first constructed on what is now termed the broad gauge, although an increased width of track had previously been proposed in the United States, and in a few instances adopted.

The South Carolina road, which is 136 miles in length, and was completed in 1833, has a gauge of five feet.

The propriety of an increased width of track was laid before two or three railroad companies, in the State of New York in 1834 and 1836, one of which adopted a width of track of six feet for its road, which extends from New York to lake Erie, a distance of 450 miles.\*

There are 63 miles of this road in operation, and the construction of a large portion of the remaining distance is rapidly progressing.

Nearly all the remaining roads in New York have a gauge of four feet nine inches.

Those of New Jersey, Ohio and Mississippi are four feet ten inches. The New Orleans and Nashville road, Louisiana, is five feet six inches, and all the roads of South Carolina, Georgia and Florida, of which

there are nearly 900 miles now in operation, have a width of track of five feet.

In nearly all the remaining States, the gauge of four feet eight and a half inches has been adopted.

In considering the question of gauge for your road, it is important not only to take into view the comparative merits of various widths of track, but the ultimate design of the road, the nature of the country through which it passes, and its connection with other lines—also the state of railway improvements in the provinces, the probable effect their construction will have on the business of the canals, and finally, the position of Canada, commercially, and the benefits that will flow from the adoption of a judicious and well matured system of railways.

The primary object of your road is to open the shortest and most direct communication between Montreal and the seaboard, affording facilities at all seasons of the year for the transmission of merchandize, passengers, and the public mails, commensurate with the wants of a great commercial public.

A glance at a map showing the Atlantic coast, the St. Lawrence valley and the upper lakes, will impress the most casual observer with the important position of your road.

In connection with the Portland road, it forms a continuous line from the St. Lawrence at Montreal to the Atlantic at Portland, which is from 70 to 100 miles shorter than any other line of improvement between these points, connecting on the one hand with a long line of inland navigation including a vast and fertile territory, and terminating on the other at one of the best harbors on the Atlantic coast.

These are the features in your road which give it a commanding position, and indicate that, ultimately, it must constitute the great thoroughfare and outlet for an immense trade. With a reasonable degree of assurance that these results will be realized, it appeared to me the part of wisdom that you should in determining on the plan of the road avail yourselves of all the improvements which long experience in this species of intercommunication may have suggested.

To keep pace with the increasing facilities of transportation, to meet the demands of a rapidly increasing trade, to compete successfully with rival lines, whose object is to divert trade from the St. Lawrence valley, and the public works of Canada, seemed sufficient reasons for giving to your road an enlarged capacity.

In northern climates it has been found extremely difficult to keep railways in a proper state of adjustment, and various expedients have been resorted to with a view more effectually to guard against the effects of frost.

Efforts to overcome this difficulty, have to a limited extent been successful, but it is only by constant attention and great cost that railways are retained in that state of repair required by a proper regard to safety and economy of transportation. Any inequalities in the surface of the rails from frost or other causes, communicates to the cars an irregular rocking motion which adds to the resistance

to be overcome and the inconvenience of passengers.

The increase of base afforded by a wider track with wheels of given size, lowers the centre of gravity and allows greater ease and steadiness of motion in the cars, and consequently less wear and tear both to the machinery and the road and less danger of accidents.

With a view to the better accommodation of passengers, many railway companies in the United States have ordered cars of increased dimensions, some of which are 9½ feet wide, yet this increase is strongly opposed by car builders and is well known to operate unfavorably from the too great overhanging weight.

On long lines it is desirable to have large and well ventilated cars which will permit each passenger to have a separate seat with arms upon which he may lean, and room sufficient to change his position without incommoding or annoying the person in the adjoining seat; comfortable saloons should be provided for ladies and children, and the passage ways through the cars should be sufficiently wide to permit passengers to walk about and pass each other conveniently. With the narrow gauge these objects cannot be accomplished; but with the width of track adopted for your road, these improvements may be readily made, and still the motion of the cars with this increased width will be easier than that of smaller cars on narrow gauge roads.

Your road will furnish a cheap and expeditious conveyance for emigrants, by which they will be enabled to reach their place of destination at the most favorable period for securing a crop the first season of their arrival in the country.

The transportation of emigrants will undoubtedly constitute an important branch of business, and for the second class cars the additional width allowed by a wider gauge, will permit an increase in the number of seats and a most advantageous arrangement for a larger number of passengers in a given number of cars. The weight of car per passenger carried would in this case be less than on narrow gauge roads. For first class passenger cars it is preferable to give superior accommodations, which increases the number of passengers and the revenue of the road, even though the weight of car per passenger should be slightly increased.

This however with your gauge remains a matter of choice; for you may have the same weight of car with the inferior accommodations of the narrow gauge or by a very small increase of weight, furnish the most superior accommodation.

This is not a question whether the company shall construct narrow and inconvenient cars because they may cost or weigh less, but it is a question in which the public are interested and have a right to claim the best accommodations which the gauge will permit. Besides it is well known that passengers are attracted in greater numbers to the road which gives the greatest accommodations; and therefore it becomes directly the interests of the company to offer every in-

\* E. F. Johnson, Esq. civil engineer, as early as 1834, communicated his views to the Auburn and Syracuse railroad company, as to the propriety of an increased width of track, and subsequently in able reports to the New York and Erie, and the New York and Albany railroad companies, advocating the wide gauge.

ducement which will secure the patronage of the public.

On the Great Western railway in England which has a gauge of 7 feet, the weight of car per passenger carried, is no greater than the average of the London and Birmingham, Grand Junction, Dover and Brighton, South Western and Midland company, but affords far superior accommodation to passengers.

On the New York and Erie railway, in the State of New York, which has a gauge of 6 feet, the weight of car per passenger carried is 85 pounds less than on the narrow gauge roads there, and affords equal room for each passenger.

The nature of the business to be done on your railroad, will undoubtedly nearly resemble that of roads in the northern part of the United States; and it is supposed that 1st class passenger and merchandize cars of a similar character to those in use there, will be found more appropriate for your road than cars of any other description. In reference to freight cars, it is believed that the wider gauge of 5½ feet will be found to afford superior advantage to those of the narrow track.

A greater width of car may be adopted which is better calculated for carrying all kinds of freight: much of which will be bulky.

The articles which would be transported to better advantage on large cars, are various kinds of light machinery, furniture, charcoal, hay, cattle, horses, calves, hogs, sheep, cotton, hops, wool, etc.

From the bulky character of such freight it will doubtless often be necessary to limit the load below the tonnage which should be carried by each car, for want of space, and in such case a loss of power is sustained;—for the number of cars in the train will be increased and their weight will compose a larger part of the gross load. With larger cars a less length of train would be required for the same tonnage, thereby lessening the resistance to be overcome from side winds, which increases with the length of the trains.

The resistance of a train in passing curved portions of a road, is also considerably lessened by diminishing its length.

Increased width of cars gives greater advantage in hauling a given load under the same circumstances; for it is well known that the power is applied more advantageously to short trains than to long ones, and by diminishing the number of cars the weight of useful tonnage carried is greater in proportion to the gross load.

Freight cars need not necessarily be any heavier on your gauge than they are now on most narrow gauge roads; but if we avail ourselves of the greater capacity, which the 5 1/2 feet track allows, the weight of car per ton of freight which may be carried, will be less than on the narrow gauge.

With a gauge of 4 feet 8 1/2 inches, it is found difficult to arrange the working parts of an engine, and to give the requisite dimensions to the fire box and boiler, without raising too much the centre of gravity.

Nearly all the engine builders in the United States, with whom I have consulted, ad-

mit that they labor under great difficulty for the want of more room, and that a gauge of 5 to 5 1/2 feet will allow them sufficient space to overcome all these difficulties.

It is owing to this inconvenience in arranging the parts and in making the repairs, that many builders have adopted outside cylinders for some of their engines.

These it is generally admitted are objectionable on many accounts, and are likely soon to get out of use, particularly for engines designed for high speed.

They are more usually adopted for freight engines, on account of the less speed they are required to run, but for these they are nearly abandoned by the principal builders of the eastern States.

It is however often the case that in order to make up for lost time, freight engines are necessarily run with great velocity, in which case all the objections to outside cylinders operate with full force. With this arrangement of the cylinders, the power is applied alternately to each side of the engine, which causes it to sway from side to side, and produces that galloping and oscillatory motion, so injurious to the machine and the road, and so productive of accidents. It is well known that by the application of the power nearer the centre of the machine, and the more favorable position of the working parts with inside cylinders, the above difficulties are avoided.

The greater space afforded by a 5 1/2 feet gauge permits the most favorable disposition of these parts, and all the benefits resulting from their central position are fully realized.

Another reason assigned for the adoption of outside cylinders, was the frequent breaking of crank axles; but it is only necessary to manufacture these with proper care and proportion, to insure exemption from the difficulty. This has already been done and they are now deemed by many builders, as safe as the straight axle.

As before remarked, it will be found that inequalities and irregularities in the track are unavoidable, where frost operates with the force that it does here, and therefore it becomes important to lessen if practicable their evil effects upon the machinery and the road.

By increasing the width of track, the motion of the engine is easier and more steady, its various parts working more freely and with less danger of injury from sudden changes. It is desirable to have as large driving wheels as practicable without raising too much the centre of gravity of the engine. By enlarging the driving wheels, the same speed may be maintained with less velocity of the piston and less friction; and as most of the weight is on these wheels, their increased size lessens the shock which the engine receives.

Large wheels permit a more efficient and economical application of the steam, lessen the wear and tear of the working parts, and with an increased base give greater steadiness and security. Both the lateral and vertical movements of the engine being easier, its action on the road will be less injurious, and there will be less danger of its leaving the track.

The more important advantages, however, resulting to the engine from a wider track, is the enlarged size of the boiler and fire box which this increased space allows.

As the power of the engine depends upon the extent of evaporating surface, all improvements which have reference to an increase of power have been directed to an enlargement of these parts.

The space, however on the narrow gauge being limited, the only means left to increase the heating surface is to lengthen the boiler and fire box. But there is a strong objection to the increased length of boiler on account of the loss of power required in creating sufficient draft through their long tubes.

To be Continued.

One of the earliest of Mr. Stephenson's locomotive engines is now employed conveying coals, on the Darlington Railway, at a less cost per ton than any other railway in England.

#### Comparative Cost of Engines and Cars made in the Shops of the Company or by Contract.

This is an important question for railway companies to decide. It is a question upon which there is a diversity of opinion. In England we believe that the companies have generally purchased them from the manufacturers—so have they mainly in this country, though many companies have, at different times, attempted to construct their own machinery, and some continue to do it in whole, and others in part; while others again have abandoned the manufacture, and only do their own repairs.

The Great Western company, it appears from the following article, are preparing, on a large scale, to make their own machinery.

They go very far beyond us, in England, in the size of some of their driving wheels. Six feet, we believe, is as far as any of our manufacturers have gone, while eight feet are not uncommon on some of the English roads.

The London Morning Herald says:

It is stated by the locomotive superintendent of the Great Western line, Mr. Daniel Gooch, an eminently practical man, and regularly educated in the locomotive workshop itself, that the company can construct a locomotive and tender of the very best materials and workmanship, without stint as to the price of steel and iron, or pay for first rate men, for £400 less than they can be procured from the manufacturer. Four hundred locomotives will, it is stated, be required to work the traffic over the broad-gauge lines in the course of construction. During the last twenty months there have been manufactured at Swindon 24 engines, with tenders, and a considerable number are now in a very forward state of construction. The completion of the works will, we are informed, enable the company to put upon the line annually 60 engines with tenders, and about 250 trucks with axles and wheels. The saving to be effected in the make of each of the trucks is set down at £20. If the calculations respecting the cost of manufacturing engines, tenders, and trucks be correct, the estimated saving over a series of years is not a very difficult arithmetical problem.

The entire cost of the works at Swindon, including the outlay for the erection of the residences for the additional number of work-

men to be employed there on the completion of the buildings in progress, will, as we are officially informed, amount to about \$220,000. The station, workshop, men's residences, cricket-ground, and the church—a very beautiful structure—occupy about 14 acres of land, which have been purchased at £200 per acre, and it is stated that the cost of the additional shops for the present exclusive manufacture of locomotives, tenders, and trucks, but which, as we have observed, will hereafter be principally devoted to the repairs of locomotive and truck stock, as well as, of course, for the manufacture of the current want of locomotive stock, will amount to about £100,000. If the company turn out locomotives, tenders, and trucks at the estimated capability of the new workshops, viz., 60 locomotives, with their tenders, and 250 trucks, per annum, with the saving contemplated, it is clear that the anticipatory erection of the additional works will realise to the Great Western people a saving of about 29,000*l.* per annum. This calculation, however, supposes that an outlay of about 25,000*l.* required for the erection of the residences of the additional number of men wanted will return 8 per cent. in the shape of rent. We are, after having inspected the houses already built at Swindon by the company, and being put in possession of a list of the rents charged, inclined to doubt whether the return upon the sum will yield more than 4 or 4½ per cent.; but as these houses will be required for the additional workpeople that must be employed in repairs, when all the lines in connection with the broad-gauge system are open to the public, we can deduct as a loss to the company only the difference between the 4 or 4½ per cent. and the 8 per cent. dividend paid to the proprietors, or the difference between the 4 or 4½ per cent. and the rate of interest at which such 25,000*l.* may have been borrowed by the company. Taking the saving at 25,000*l.* and not at 29,000*l.* per annum, and the anticipatory construction of the new works will, by the preliminary devotion of them to the manufacture of locomotive stock and trucks, produce to the company, in the course of four years, the entire cost of such works.

The locomotives that have been built at the Swindon works, and now running on the line, are amongst the best ever manufactured in this country. Not only are they the most powerful in the world, both as respects their capability to deal with heavy loads and attain high velocities, but their manufacture may be said to be almost perfect. We have frequently been over the shops when the men have been at work, and have derived much pleasure from observing the great care with which all of them attended to the duties committed to their charge. The most sedulous attention is paid to their spiritual and moral welfare by a painstaking and excellent clergyman; a well-selected library has been provided for them; a mechanics' institution formed, and a cricket ground opened for their amusement; and the happy consequence is, that a more intelligent, industrious, or well-behaved body of mechanics is

not, we believe, to be found in the kingdom.

A few weeks since we gave the quantity of coke burnt by the "Great Britain," eight-wheeled engine, with a train of 90 tons, travelling at an average speed of about 37 miles per hour, between Paddington and Swindon, with five stoppages. The quantity was as high as 51 lb. per mile, and the train was very heavy, a strong wind prevailing during the whole journey, and the velocity was very high. Yesterday we had an opportunity of ascertaining the consumption of coke by the "Iron Duke," one of the eight-wheeled class of locomotives, with a train of about the same weight as the one already alluded to, but travelling at an average velocity of only 27 miles per hour, between Paddington and Swindon, with the five stoppages, and back with 60 tons at upwards of 25 miles per hour, with sixteen stoppages, and we found the average consumption of coke over the whole journey was under 29 lb. per mile. The "Iron Duke" has an eight feet driving wheel, 18 inch cylinder, and 24 inch stroke. With 60 tons up from Swindon yesterday, the driver cut off his steam at 9 inches, and kept his time at the stations with perfect ease. We believe this consumption of coke, taking the weights of the trains, the stoppages, and the speed into calculation, is as low as upon any line in the kingdom.

#### Buffalo and Mississippi Railroad.

## REVENUE FROM PASSENGERS.

The information collected concerning this division of our investigation separates itself into several parts.

FIRST.—A distinct portion of the travel passes through Chicago, and is that furnished or attracted by the Buffalo and Chicago steamboats, and the Mail-steamboat running between Chicago and St. Joseph, in connection with the Central Railroad in Michigan.

From the best authority, the number of passengers passing east and west, taking the above boats, during the navigation season, is 500 a day. Calling the season six months, or 180 days, we have for the annual number 90,000 passengers. Allowing that only 54,000 of these would go on the rail-road, at \$6 each, the revenue from this source would amount to \$324,000.

SECOND.—In the table of statistics, (page 40, column 20,) we have given the number of travellers passing through each of the five northern counties of Indiana, destined east and west. As these counties are situated in an east and west direction, it is supposed, the numbers are only different estimates of the same travellers, and do not include those bound in a transverse direction, who would necessarily be intercepted by the road, and would more or less contribute to its support, taking the average of these counties (say 13,000) to be the number of through-passengers, paying at the rate of \$6, we have a farther accession to the revenue of \$78,000.

THIRD.—Considering emigrants as passengers of the second class, we get from column 19 of the table the average number, say 20,000, who would pay \$4.50 each—yielding to the revenue 90,000. Under this item we may include the freight which the emigrants would pay for the transportation of their teams, goods, and perhaps much of their live stock; neglecting, however, the live stock, each wagon would weigh, on an average, 900lbs., the load 1600lbs., and the horses 1500lbs.—together, two tons. The number of wagons (see column 18 of the table) we will call 5,000, making the total weight 10,000 tons; which, at \$5 a ton over the whole road, gives for this part of the revenue \$50,000. Adding together the revenue from the emigrants and their freight,

we should get from this source \$140,000; but as the whole of the emigrants and freight might not take the road, and as many who did might not pass over its whole length, we will make a liberal allowance, and call the revenue \$100,000.

FOURTH.—The way-travel, which we consider distinct from the second item, depends upon the density of the population, and in some degree on the amount of capital employed in manufacturing purposes, within a limited range of the railroad. It was estimated by the Directors of the New York and Erie railroad, in their second report in 1841, that the population in the counties contiguous to the Erie canal, its branches, and the railroads and other roads along its line, contributed to the revenue of those works, at the rate of three dollars per individual. Applying this rule to the population given at page 66, viz: 140,606 souls, we should obtain for this item, the sum of \$421,818. But as this ratio seems high; and, as it may be, that the different occupations and circumstances of trade, differ in the two districts, having some influence on this ratio, we will call the revenue from this source, only half of the above amount, say \$200,000.

FIFTH.—The above four items are specific, and based on reliable data. To these we propose to add a fifth item, embracing those passengers who would be diverted from other present channels of communications, besides those above considered, in consequence of the greater facilities offered in the proposed road, by the saving of time, expense, and avoiding of greater risk of life, and injury, in river, canal or lake boats. The railroad, if constructed upon the substantial plan the estimate contemplates; and if a speed of perhaps 40 miles an hour be adopted; would attract many travellers from other parallel lines, and may have in many cases a controlling influence in directing other roads yet to be built, towards this main artery between the east and west. Possibly a portion of the Canada travel, to take advantage of the superior facilities of the line, might be drawn across or around the head of Lake Erie, and contribute to the revenue. Should a railroad be built from Detroit to Toledo, with a distance no greater than that found by a direct route measured on Farmer's Map of Michigan: say 53 miles. The distance from Detroit via Toledo to Michigan city, would be the same as from Detroit via Central railroad and St. Joseph, thus:—

Detroit to Toledo,.....	53 miles.
Toledo to Michigan City,.....	186 "
	239 "
Detroit to St. Joseph,.....	202 miles.
St. Joseph by land to M. city,.....	37 "
	239 "

Under the above considerations, and for the immediate contributions of such sources, is added the sum of \$50,000.

## REVENUE FROM FREIGHT.

Much as has been given in the preceding pages, with a view of satisfying those persons who may take an interest in this project, that there would be carried on the road, a large amount of the products of the field, forest,

mines, and manufactures, within its own proper region; and that it would draw largely from the other connected lines of communication already in operation, in process of completion or projected; when all should form one extended system. Still it is somewhat difficult to assign satisfactorily, the precise amount of a portion of the freight which would be offered to the road at certain points; and the revenue to be derived therefrom. In other districts we have good assurance that the road would be well encouraged; and we proceed to show the estimated amount of receipts, based on a tariff which would compete with the lake navigation; using recent statistics, particularly the table at pages 38, 39, 40, 41.

FIRST.—Of the business which was done at Chicago in 1844-5 [see p. p. 43—44—45] the road would probably take of the high cost, and light articles, an amount, which would yield a revenue of \$26,000. But if the light and costly goods now imported into St. Louis for its own consumption, and for the trade of the Upper Mississippi, are to be diverted on the opening of the Illinois and Michigan canal, and the Chicago and Galena railroad; from the Ohio and Mississippi rivers, the present channels, to the lakes; we might with safety rely on the above amount being increased to \$50,000. And if we add to this sum, the revenue to be derived from wheat, and other cheap articles, which would without question, be transmitted over the road from Chicago, during the winter, \$50,000, we have altogether for this item, \$100,000.

SECOND.—The amount of way-freight can be stated with more certainty. Wheat, on which the charges for freight would compete with the lake navigation in the summer season, forwarded—

From eleven counties in Indiana, would pay.....	\$365,125
From the two counties in Ohio, Williams and Lucas,.....	24,001
From five counties in Michigan,.....	114,372
	\$503,500

Revenue from merchandise imported into the same 18 counties,.....	37,080
Revenue from Salt imported into the same 18 counties,.....	13,369

Aggregate revenue from some of the most important articles of export and import, \$454,950.

THIRD.—This item is contingent like the 5th item of the passenger revenue; and is added for the same general reasons, depending upon the superior facilities anticipated from this line, in consequence of its direct connection with the Ohio railroad to Cleveland, the Illinois and Michigan canal, and the Chicago and Galena railroad. It is supposed that 2500 tons, exclusive of the tonnage belonging to St. Louis and Galena, noticed in the 1st item, would be a small allowance for this portion of the business; calling the charge 3 cents per ton per mile, or \$7 00 through,—

The revenue would be,.....	\$17,500
FOURTH.—For carrying the United States Mail, say.....	22,550

## RECAPITULATION.

Gross Revenue from Passenger Travel, 1st item—Through travel diverted from

steamboats, .....	\$324,000
2d item—Through travel now passing along the route, .....	78,000
3d item—Emigrants and their freight, .....	100,000
4th item—Way travel, .....	200,000
5th item—Contingent travel, .....	50,000

\$752,000

**Gross Revenue from Freight.**

1st item—Through freight furnished by Chicago, .....	\$160,000
2d item—Way freight, .....	451,950
3d item—Contingent freight, .....	17,500
4th item—Carrying the United States Mail, .....	22,550

\$595,000

Total estimated revenue for Freight and Passengers, .....

\$1,317,000

Deduct annual cost of working the road, say 50 per cent. of the Gross Revenue, .....

\$673,500

Net Revenue—equal to 15½ per cent. on \$4,267,000 the estimated cost of the road with a 59 lbs. rail, or nearly 13 per cent. on \$5,215,000, the estimated cost with a 80 lbs. rail, .....

\$673,500

It should be stated here, that the above estimate of the revenue from freight supposed to be carried over the road at rates competing with the Lake navigation, includes all the exports and imports given in the statistics properly belonging to the way-business. If we retain these competing prices, a portion of the business might still be conducted by the lake boats; but a small reduction in the railroad tariff would ensure this business to the road: still it is assumed, that the road will be taken in preference to the lake boats; even if the charges are alike.

The total tonnage included in the above four items of freight which would move on the railroad east and west, is estimated at 124,600 tons. Of this tonnage it is estimated 106,600 tons will move east; and 18,000 tons west—and the whole tonnage would be equivalent to 17,854,616 tons carried one mile, computing upon the actual distances the freight would pass on the road. There was carried on the Western railroad in 1845, 14,560,223 tons one mile.

The average cost per ton per mile, of the same total tonnage is 3½ cents, excluding, of course the emigrant teams and their effects. The amount of tonnage passing east in a year, would require two trains a day, each to load with 170 tons of freight, this load, however, would be confined to the most easterly locomotive stages of the road, and where there would be no grades of importance to ascend, the country being flat. The average daily load of a train passing east from Indiana into Ohio, and which would have to pass up a grade of 44 feet per mile, is found to be 150 tons; and at points further west the loads would be diminished.

The freight engines made by Messrs. Hinckley & Drury with eight wheels, have an insistent weight on the driving wheels of 30,000 lbs. Calling the friction of the train 8 lbs. per ton, and the adhesion of the driving wheels one-fifth of the insistent weight, we get a power to draw up a plane 45 feet to a mile, a gross load of 480,000 lbs. nearly, including the tender, the net load in this car might be called 152 tons; consequently we have a power sufficient to draw the required load of 150 tons up the grade of 44 feet per

mile. It would be expedient to arrange the locomotive stages, so as to have a short one to include the three steep grades at miles 67, 79 and 82 on the line—[see p. p. 19]; such an arrangement would allow the engines on that division to make three trips a day, on the occurrence of an extra amount of freight to be forwarded east.

The passenger engines, made by the same company, weighing 16 tons, with 12 tons insistent weight on the driving wheels, would have ample power to draw the regular trains fully loaded, up grades rising at the rate of 45 feet per mile, supposing the train to be composed of

2 first class 8 wheel pass'g'r cars, car'g. 128 pass'g'rs.	
1 second " " " " " " " " " "	61
1 baggage 4 wheeled car, " " " " " "	4½ tons.
3 cars for emigrant's effects, " " " " " "	11½ "

Such a train could be propelled up the supposed grade at a velocity exceeding 30 miles an hour, provided the boiler of the locomotive had sufficient power to produce the requisite quantity of steam. That is to say, the adhesion would be sufficient to draw the load at that velocity.

**PASSENGERS MOVED ON THE RAILROAD.**

The total number of passengers, which will pass on the road, in both directions, reduced to through passengers, may be stated as follows:

Number of passengers according to the 1st item of passenger revenue, .....	54,000
Number of passengers according to the 2d item of passenger revenue, .....	13,000
Number of passengers according to the 3d item of passenger revenue, .....	14,222
Number of passengers according to the 4th item of passenger revenue, .....	33,334
Number of passengers according to the 5th item of passenger revenue, .....	8,334

Total number reduced to through passengers, 122,890

Total number daily, reduced to through passengers, .....

392

Allowing four trains to run over the road per day, the quota for a train would be 98 passengers.

The effects of the emigrants would amount to 7,200 tons annually, and if we suppose the whole to be moved westwardly by two trains, the amount per train would be 11½ tons. These effects in practice, would no doubt be carried by the freight trains, as they generally would go light loaded in returning west, and relieve the passenger trains of this part of their burden, supposed in the statement above, to be attached to them, amounting with the three cars to about 10 tons.

The railroad, we are satisfied, could be worked as cheaply as any of the railroads in Massachusetts. The fuel for the locomotives could be had for a trifle more than the cost of cutting and hauling it to the several depots along the line. Coal for the repair shops, at either terminus of the road, could be had at exceedingly low prices, and could be substituted for the wood fuel of the locomotives, when the country becomes divested of the present extensive tracts of timbered lands. The unfrequency of deep snows would exempt the road from an item of expense, which is of considerable importance on the eastern rails, for here the snow seldom covers the ground in depth exceeding 6 or 8 inches. The cause of this deficiency of snow may be

sought for, in the peculiar position of the strip of country through which the line runs, in relation to the great sheets of water forming the Upper Lakes. One of these, Lake Michigan, having a depth increasing from 600 feet at its south end, to 900 feet at its north; never freezes entirely over; and the ice that is formed, is kept in motion much of the time by the winds, which drift it along the shores, or drives it from one side of the lake to the other. The prevailing wind blows from the northwest, wafting the warmed atmosphere from the surface of the lake, over northern Indiana and Ohio, probably changing into rain, what otherwise would be snow in those districts. In summer, by the same operation of nature, the temperature of the same region, is kept comparatively cool.

In our estimate of the revenue of the railroad, we have endeavored to exhibit a fair statement of the business that may be anticipated for the first year or two after the road has been opened: but should others form a different opinion from what has been given here, I would refer them for further evidence of the great increase of the lake commerce to the numerous publications which have appeared from time to time in the newspapers and public journals, and to the more authentic reports made at different times to Congress, touching the actual state and progress of this commerce, and the statistics of the states and territories bordering the lakes.

It is allowed on all hands, that alleviations from the existing impediments and inconveniences are greatly wanted on these waters; and that government, in case of refusing aid for removing these inconveniences, would seriously affect the enterprise of a large portion of the Union.

I feel in a degree authorized to allude here to an opinion, concerning the importance of the lake commerce, formed by the Board of Commissioners who went out from government in 1845 to view the harbors and other public works on the lakes. I have been informed that they, after their investigation, came to the conclusion (which possibly has been published) that such was the increase, prospectively considered, of the business on the lakes, and the difficulties which presented themselves in opposition to any feasible plan, for accommodating the navy that would be required in a few years; that if government should then begin to erect the necessary structures, supposing they could appropriate the large sums of money that would be wanted, these works could not be executed with the acceleration the necessities of the trade would demand.

Under such an impression of the amount of business which is in a few years to have place, according to the view just stated, can it be doubted that a railroad line so acceptable in its geographical and statistical position, would not yield to the stockholders a liberal remuneration, and at the same time be a work, both in a civil and military point of view, of great public convenience.

I am most respectfully,  
Your obedient servant,

GEO. R. BALDWIN.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

2m32

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

### WELDED WROUGHT IRON TUBES

From 4 inches to 48 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L., and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PLUM.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents,**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

**CHILLED RAILROAD WHEELS.—THE** undersigned are now prepared to manufacture their improved Corrugated Car Wheels, or Wheels with any form of Spokes or Disks, by a new process which prevents all strain on the metal, such as is produced in all other chilled wheels, by the manner of casting and cooling. By this new method of manufacture, the hubs of all kinds of wheels may be made whole—that is, without dividing them into sections—thus rendering the expense of banding unnecessary; and the wheels subjected to this process will be much stronger than those of the same size and weight, when made in the ordinary way.

**A. WHITNEY & SON,**

Willow St. below 13th,

Nov. 10, 1847: [if.] Philadelphia, Penna.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

FOR

PASSENGERS, SPECIE, GOODS, PARCELS, etc.

To all parts of the United States, North and South America, West Indies, India, [overland or otherwise,] Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

**ROBERT GRACIE.**

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**

Willow Street Wharf,

Philadelphia, Pa.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal Iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by **JOHN A. ROEBLING, Civil Engineer,** Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

93v11y

### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark-Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms. Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP** and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y.

The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriut, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co., Boston. ja45

### MACHINE WORKS OF ROGERS,

Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,** a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,294 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
567 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,350 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge.	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia. 33f

## LAP—WELDED WROUGHT IRON TUBES

FOR

## TUBULAR BOILERS, FROM 1 1-4 TO 6 INCHES DIAMETER, and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address

J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1y\* Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
**EDMUND DRAPER,**  
Surviving partner of  
**STANCLIFFE & DRAPER.**

No 23 Pear street,  
1y10 near Third,

below Walnut,  
Philadelphia.

**THE SUBSCRIBER** has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

**ANDREW MENEELY.**

West Troy, May 12, 1847.

1y\*21

**PIG AND BLOOM IRON.—THE SUBSCRIBERS** are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

**A. WRIGHT & NEPHEW,**  
Vine St. Wharf, Philadelphia.

12f

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

**MURDOCK, LEAVITT & CO.,**

Agents.

1y48

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC** Cement. This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by **JOHN W. LAWRENCE,**  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 1y

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber. These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH Tons.
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.		
	INCH.	LBS. OZ.	INCH.	LBS. OZ.	LBS.	INCH.		
11	4 1/2	13 5	10	21 -	50	15-16		20
13	3 1/2	9 3	8 1/2	16 -	27	11-16		13 1/2
14	3 1/2	6 11	7 1/2	12 8	17	9-16		10 1/2
15	2 1/2	5 2	6 1/2	9 4	13 1/2	1-2		7 1/2
16	2 1/2	4 3	6	8 8	10 1/2	7-16		7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street, Philadelphia, Pa.

1y25

**NICOLI'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

ja15

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co. have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,] WILLIAM REE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Supt Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845. N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

1y19 Supt Motive Power.

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER & CO.,

59 North Wharves,  
Jan. 14, 1846. [1y4] Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,  
No. 45 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,  
Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip,  
New York.

1y10

## NORRIS' LOCOMOTIVE WORKS.

BUSH HILL, PHILADELPHIA, Pennsylvania.

**M**ANUFACTURE their Patent 6 Wheel Combined and 8 Wheel Locomotives of the following descriptions, viz:

Class	1	15 inches Diameter of Cylinder, × 20 inches Stroke.
"	2,	14 " " " (× 24 " "
"	3,	14½ " " " × 20 " "
"	4,	12½ " " " × 20 " "
"	5,	11½ " " " × 20 " "
"	6,	10½ " " " × 18 " "

With Wheels of any dimensions, with their Patent Arrangement for Variable Expansion. Castings of all kinds made to order: and they call attention to their Chilled Wheels, for the Trucks of Locomotives, Tenders and Cars.

NORRIS, BROTHERS.

**K**EARNEY FIRE BRICK. F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size, made to order. Terms, mos. from delivery of brick on board. Refer to

James P. Allaire, }  
Peter Cooper, } New York.  
Murlock, Leavitt & Co. }  
J. Triplett & Son, Richmond, Va.  
J. R. Anderson, Tredegar Iron Works, Richmond, Va.  
J. Patton, Jr. } Philadelphia, Pa.  
Colwell & Co. }  
J. M. L. & W. H. Scovill, Waterbury, Conn.  
N. E. Screw Co. } Providence, R. I.  
Eagle Screw Co. }  
William Parker, Supt. Bost. and Worc. R. R.  
New Jersey Malleable Iron Co., Newark N. J.  
Gardiner, Harrison & Co. Newark, N. J.  
25,000 to 30,000 made weekly. 35

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gear-ing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** a45 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia. 25

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 1½ to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,  
12 Platt street, New York.  
JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 28

**S**PRING STEEL FOR LOCOMOTIVES, Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**T**HE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.  
ROBERT NICHOLS, Agent,  
No. 79 Water St., New York. 26

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28

J. BALL &amp; CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between the two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m., on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**PATERSON RAILROAD**  
Summer Arrangement.  
Commencing April 20th, 1847, the cars will leave  
Paterson at New York at  
8 o'clock a.m. 9½ o'clock a.m.  
11½ o'clock a.m. 12 1-4 o'clock p.m.  
4 o'clock p.m. 5½ o'clock p.m.  
On Sunday.  
8 o'clock a.m. 9½ o'clock a.m.  
4 o'clock p.m. 5½ o'clock p.m.  
Office 75 Courtlandt St. 25

**CONCORD RAILROAD.—PASSENGER**

Trains in connection with the Lowell & Nashua Railroads, run daily between Concord and Boston, Sundays excepted, as follows, viz:

Leave Concord at 5 40 and 11 5 a.m. and 3 15 p.m.  
Leave Boston at 7 and 11 a.m. and 5 p.m.

This road runs by Nashua and Manchester to Concord N. H., where it connects with the Northern railroad, extending from Concord to the mouth of White river in Vermont, 18 miles of which road, to Franklin, is now opened, and the remainder is rapidly completing.

It is the direct route to Central and northern New Hampshire, and to Montpelier, Burlington, and other towns in northern Vermont, and has a greater proportion of railroad conveyance in those directions than any other line.

It is also the British Steam Mail Line, and the nearest route from Boston to the Canadas. Numerous stages connect with all parts of the road.

For further information, apply at B. P. Cheney & Co.'s Express office, No. 8 Court St., and Averill & Dean, No. 15 Elm St.

All passengers' baggage should be properly marked, and when valued at more than \$50, notice must be given, and extra charges paid, or no loss beyond such amount will be allowed.

N. G. UPHAM, Supt.

**NORWICH AND WORCESTER RAILROAD.**

Summer Arrangement. Change of Hours. Commencing on

Wednesday, April 21, 1847.

Accommodation Trains, daily, (except Sunday.) Leave Norwich, at 6 a.m., and 4 1/2 p.m. Leave Worcester, at 8 1/2 a.m., and 4 1/2 p.m.

The morning Accommodation Trains from Norwich, and from Worcester, connect with the trains of the Boston, and Worcester and Western railroads each way.

The Evening Accommodation Train from Worcester connects with the 2 1/2 p.m. train from Boston.

New York Train via Steamboat—Leave Norwich for Boston, every morning, except Monday, on the arrival of the steamboat from New York, stopping at Norwich and Danielsonville.

Leave Worcester for New York, upon the arrival of the train from Boston, at about 6 1/2 p.m., daily, except Sunday, stopping at Danielsonville and Norwich.

Freight Trains daily each way, except Sunday.—Leave Norwich at 7, and Worcester at 6 30 a.m. Special contracts will be made for cargoes, or large quantities of freight, on application to the superintendent.

Fares are Less when paid for Tickets than when paid in the Cars.

J. W. STOWELL, Supt.

**LONG ISLAND RAILROAD COMPANY.**

Summer Arrangement. On and after Monday May 1st, trains will run as follows, except Sundays:

Leave—Brooklyn at 9 1-2 a.m. for Farmingdale, 1 1-2 p.m. for Greenport, at 4 p.m. for Farmingdale.

Leave Farmingdale at 7 a.m. for Brooklyn, 12 m. do., at 3 1-4 do. do.

Leave Greenport at 8 1-2 a.m. for Brooklyn.

Leave Jamaica at 8 a.m. for Brooklyn, at 1 p.m. do., at 4 1/2 p.m. do.

On Saturdays, a train will leave Brooklyn for Yaphank, at 4 p.m. Leave Yaphank, on Mondays for Brooklyn at 5 1-2 a.m.

On and after May 15th, and until September 1st, 1847, a train will leave Jamaica at 7 a.m. for Brooklyn—leave Brooklyn at 6 p.m. for Jamaica, and will land and receive passengers at any place between Brooklyn and Jamaica.

On Sundays—leave Brooklyn at 8 1-2 a.m. for Farmingdale; leave Farmingdale at 4 p.m. for Brooklyn.

Freight Trains—leave Brooklyn at 10 a.m. for Greenport; leave Greenport at 12 m. for Brooklyn.

Baggage crates will be in readiness at the foot of Whitehall street, to receive baggage for the several trains, 30 minutes before the hour of starting from the Brooklyn side.

The steamer "Statesman," Captain Nash, leaves Greenport for Sag Harbor on the arrival of the Accommodation train from Brooklyn.

DAVID S. IVES, Supt.

**BOSTON AND MAINE RAILROAD.**

Upper Route, to Portland and the East.

WINTER ARRANGEMENT, Commencing October 4, 1847.

PORTLAND TRAINS.  
Leave Boston at 7 A.M. and 2 1/2 P.M.  
Leave Portland at 7 1/2 A.M. and 3 P.M.

GREAT FALLS TRAIN.  
Leave Boston at 3 1/2 P.M.  
Leave Great Falls at 6 1/2 A.M.

LAWRENCE TRAINS.  
Leave Boston at 7 1/2 A.M., 2 1/2, 3 1/2, 5 1/2 p.m.  
Leave Lawrence at 7 8 1/2, 11 a.m., 3 1/2, 6 1/2 p.m.

HAVERHILL TRAINS.  
Leave Boston at 11 1/2 A.M. and 5 1/2 P.M.  
Leave Haverhill at 7 A.M. and 3 1/2 P.M.

READING TRAINS.  
Leave Boston at 8 1/2 A.M. and 6 1/2 P.M.  
Leave Reading at 6 50 A.M. and 1 1/2 P.M.

MEDFORD BRANCH TRAINS.  
Leave Boston at 7 1/2 a.m., 12 m., 2 1/2, 4 1/2, 6 p.m.  
Leave Medford at 7 8 1/2 a.m., 1 1/2, 3 1/2, 5 p.m.

The Depot in Boston is on Haymarket Square.

CHAS. MINOT, Supt.

ly31

**BOSTON AND PROVIDENCE RAILROAD.**

Passenger Notice. Summer Arrangement. On and after Monday, April 5, 1847, the Passenger Trains will run as follows:

Steamboat train via Stonington—Leaves Boston every day, except Sunday, at 5 o'clock p.m.

Accommodation Trains—leave Boston at 7 and 10 1/2 a.m. and 4 p.m., and Providence at 7 1/2 and 10 1/2 a.m. and 4 1/2 p.m.

Dedham trains, leave Boston at 8 a.m., 12 1/2, 3 1/2, 6 1/2 and 9 p.m., Leave Dedham at 7 and 9 1/2 a.m. and 2 1/2, 5 1/2 and 8 p.m.

Stoughton trains, leave Boston at 11 1/2 a.m. and 5 1/2 p.m. Leave Stoughton at 7 10 a.m. and 3 1/2 p.m.

All baggage at the risk of the owners thereof.

W. RAYMOND LEE, Supt.

**NEW YORK & HARLEM RAILROAD CO.**

Summer Arrangement.—On and after Tuesday, June 1st, 1847, the cars will run as follows, until further notice.

Up trains will leave the City Hall for—Yorkville, Harlem and Morrisana at 6, 8 and 11 a.m., 2, 9 30, 5 and 7 p.m.

For Morrisana, Fordham, Williams' Bridge, Tuckahoe, Hart's Corner and White Plains, 7 and 10 a.m., 4 and 5 30 p.m.

For White Plains, Pleasantville, Newcastle, Mechanicsville and Croton Falls, 7 a.m. and 4 p.m.—Freight train at 1 p.m.

Returning to New York, will leave—Morrisana and Harlem, 7, 8 20 and 9 a.m., 1, 3, 4 30, 6, 6 28 and 8 p.m.

Fordham, 8 08 and 9 15 a.m., 1 20 and 6 15 p.m. Williams Bridge, 8 and 9 08 a.m., 1 10, 6 08 p.m.

Tuckahoe, 7 38 and 8 25 a.m., 12 55 and 5 52 p.m. White Plains, 7 10 and 8 35 a.m., 12 50, 5 35 p.m.

Pleasantville, 8 15 a.m. and 5 15 p.m. Newcastle, 8 a.m. and 5 p.m.

Mechanicsville, 7 46 a.m. and 4. 48 p.m. Croton Falls, 7 30 a.m. and 4 30 p.m. Freight train at 10 a.m.

Freight train will leave 32d street for Croton Falls and intermediate places, 4 a.m. and City Hall 1 p.m.

Returning, leave Croton Falls 10 a.m. and 9 1/2 p.m.

ON SUNDAYS, the trains will run as follows: Leave City Hall for Croton Falls, 7 a.m., 4 p.m. Croton Falls for City Hall, 7 30 a.m., 4 30 p.m.

Leave City Hall for White Plains and intermediate places, 7 and 10 a.m., 4 and 5 30 p.m.

White Plains for City Hall, 7 10 and 8 35 a.m., 12 30 and 5 35 p.m.

Extra trains will be run to Harlem, Fordham and Williams Bridge on Sunday, when the weather is fine.

The trains to and from Croton Falls will not stop on N. York island, except at Broome st. and 32d st.

A car will precede each train 10 minutes to take up passengers in the city.

Fare from New York to Croton Falls and Somers \$1, to Mechanicsville 87c., to Newcastle 75c., to Pleasantville 62c., to White Plains 50c.

25tf

**WESTERN RAILROAD.—ON AND AFTER**

Monday, April 5, 1847, the passenger trains will leave daily, Sundays excepted, as follows:

Boston at 8 a.m. and 4 p.m. for Albany.

Albany at 7 1-4 a.m. and 5 p.m. for Boston.

Springfield at 8 1-2 a.m. and 1 p.m. for Albany.

Springfield at 8 1-2 a.m. and 1 1-2 and 3 p.m. (on arrival of the train from New York) for Boston.

Day line to New York, via Springfield.—The steamboat train leaves Boston at 6 a.m., and arrives in New York at 7 p.m., by the steamboats Traveler, New York, or Champion.

Returning, leaves New York at 6 1-4 a.m., and arrives in Boston at 7 p.m.

Night line to New York.—Leaves Boston at 4 p.m., and arrives in New York at 5 a.m.

Albany and Troy.—Leave Boston at 8 a.m., Springfield at 1 p.m., and arrive in Albany at 6 p.m.; or, leave Boston at 4 p.m., Springfield next morning at 8 1-2, and arrive in Albany at 1 1-2 p.m.

The Troy trains connect at Greenbush.

The trains for Buffalo leave at 7 1/2 a.m. and 7 p.m. For Northampton, Greenfield, etc.—The trains of the Connecticut River Railroad leave Springfield at 9 1-4 a.m., 1 and 3 p.m., and passengers proceed directly on to Brattleboro', Windsor, Bellows Falls, Walpole, Hanover, Haverhill, etc.

For Hartford.—The trains leave Springfield on the arrival of the trains from Boston.

The trains of Pittsfield and North Adams Railroad leave Pittsfield on the arrival of the trains from Boston.

N. B.—No responsibility assumed for any baggage by the passenger trains, except for wearing apparel not exceeding the value of fifty dollars, unless by special agreement.

JAMES BARNES, Supt. and Eng'r.

C. A. SEAD, Agent, 27 State street, Boston.

**NEW YORK AND ERIE RAILROAD LINE**

SUMMER ARRANGEMENT. For passengers, twice each way daily, (except Sunday,) leave New

York from the foot of Duane St. at 7 o'clock, A.M. and at 4 o'clock, P.M. by steamboat, for Piermont, thence by cars to Ramapo, Monroe, Chester, Goshen, Middletown, Otisville, and the intermediate stations.

The return trains for New York will leave Otisville at 6 30, A.M. and 4 15, P.M.; Middletown at 7 A.M. and 4 40, P.M.; Goshen at 7 22, A.M. and 5 3, P.M.; Chester at 7 35, A.M. and 5 18, P.M.

Fare between New York and Otisville, \$1 50; way-fare in proportion.

For Milk—Leave Otisville at 5 1/2 o'clock, morning and evening.

For Freight—The barges "Samuel Marsh and "Henry Suydam, Jr." will leave New York (from the foot of Duane St.) at 5 o'clock, P.M. daily (except Sundays.)

No freight will be received in New York after 5 o'clock, P.M.

Freight for New York will be taken by the trains leaving Otisville at 10 1/2 o'clock, A.M.; Middletown at 11 1/2, A.M.; Goshen at 12 1/2, P.M.; Chester at 1 o'clock, P.M., etc., etc.

For further particulars, apply to J. F. CLARKSON, Agent, corner of Duane and West Sts., New York, or to S. S. POST, Superintendent Transportation, Piermont.

24tf

**H. C. SEYMOUR, Supt.****GREAT SOUTHERN MAIL LINE! VIA**

Washington city, Richmond, Petersburg, Weldon and Charleston, S. C., direct to New Orleans.

The only Line which carries the Great Southern Mail, and Twenty-four Hours in advance of Bay Line, leaving Baltimore same day.

Passengers leaving New York at 4 1/2 P.M., Philadelphia at 10 P.M., and Baltimore at 6 1/2 A.M., proceed without delay at any point, by this line, reaching Richmond in eleven, Petersburg in thirteen and a half hours, and Charleston, S. C., in two days from Baltimore.

Fare from Baltimore to Charleston, \$31 00

Richmond, 5 60

For Tickets, or further information, apply at the Southern Ticket Office, adjoining the Washington Railroad Office, Pratt street, Baltimore, to

STOCTON & FALLS, Agents.

ly14

**BALTIMORE AND OHIO RAILROAD.**

**MAIN STEM.** The Train carrying the Great Western Mail leaves Baltimore every morning at 7 and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13½

**LITTLE MIAMI RAILROAD COMPANY.**

Fall and Winter Arrangement, 1817. On and after Monday, September 20th, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Yellow Springs, and Springfield. Returning, will leave Springfield at 4½ a.m. Upward train arrives at Cincinnati at 2½ p.m. Downward train arrives at Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore & Co. are running the following stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheeling, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanesville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine & the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, is 32 hours. Distance from Cincinnati to Springfield by railroad.....84 miles.

From Springfield to Bellefontaine by stage, over a good Summer road.....32 "

From Bellefontaine to Sandusky city by railroad.....102 "

FARE—From Cincinnati to Lebanon.....\$1 00

" " " Xenia.....1 50

" " " Springfield.....2 00

" " " Columbus.....4 00

" " " Sandusky city 7 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

W. H. CLEMENT, Sup't.

**BALTIMORE AND SUSQUEHANNA**

Railroad.—Reduction of Fare. Morning and Afternoon Trains between Baltimore and York.—The Passenger trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....9 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.  
Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**

Fare to York.....\$1 50  
" Wrightsville.....2 00  
" Columbia.....2 12½

Way points in proportion.

**PITTSBURG, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburgh via stage to Harrisburg.....\$9  
Or via Lancaster by railroad.....10  
Through tickets to Harrisburg or Gettysburg.. 3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owing's Mill, arriving at the Mills at.....5½ p.m.  
Returning, leaves Owing's Mills at.....7 a.m.

D. C. H. BORDLEY, Sup't.

31 1y Ticket Office, 63 North st.

**L EXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35 1y

**CENTRAL AND MACON AND WESTERN**

Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad.....190 Miles.  
Macon to Atlanta—Macon and Western.....101

Atlanta to Oothcaloga—Western and Atlantic.. 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....\$0 50 To Atlanta. To Oothcaloga, \$0 75

Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....0 50 0 62½

On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....0 20 0 26

Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....0 20 pr. 100 lbs. 35

Crockery, per cubic foot.....0 15 " " 35

Molasses and Oil, per hhd., (smaller casks in proportion). 9 00 12 50

Ploughs, (small,) and Wheelbarrows.....0 80 1 05

Salt, per Liverpool Sack.....0 70 0 95

Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846. 1y21

**CENTRAL RAILROAD—FROM SAVANNAH**

to Macon. Distance 190 miles. This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods... 13 cts. per cubic ft. On brls. wet (except molasses and oil).....\$1 50 per barrel. On brls. dry (except lime)... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery.....40 cts. per hundred. On hdds. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd. On molasses and oil.....\$6 00 per hhd.

Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Sup't. Transportation.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston, on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tuscumbia.....22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad. JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAILROAD**

line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.

Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00

Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25y

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, November 27, 1847.

## A WORD TO THE FEW.

The current volume of the Journal is nearly completed—four numbers more, and the Index, will complete the twentieth volume, and the fiftieth year of its publication. There are yet quite a number of accounts for the current year—as well as a few for previous years—which are not paid. This delay to each subscriber cannot benefit the parties—while to us the delay of one or two hundred is a very serious matter, and may even be the cause of discontinuing the publication entirely.

The difficulty, and expense, of sending an agent to each subscriber—scattered, as they are, all over the Union—is to great to be encountered; and the losses from removal, changes of circumstances and death—when the accounts are suffered to run for several years—are to great for so small a circulation; therefore it has become a matter of necessity to call upon those in arrears to remit the amount by mail at once—before the close of this volume, if possible; and I will add that it will save trouble and postage, and be only a fair return for past delays, to enclose, at the same time, the next year's subscription. By doing so, they will materially promote our convenience, and the prosperity of the Journal.

I shall hereafter, while the Journal is under my charge, give to it my undivided attention, and hope to be able to make it deserving of a prompt and liberal support, and I shall look to every friend of the cause for aid in sustaining it.

D. K. MINOR, Editor.

Correction.—In the Report of Mr. Morton, on the Gauge question—page 749, line 13 from top of first column—for "85," read 35 pounds less.

ELIJAH PACKARD,  
ISAAC MILLS,

SPRINGFIELD, MASS.

## Louisville and Frankfort, Ky., Railroad.

The surveys upon this line have, we are informed, been prosecuted with spirit and success for some months past, with good success. A very favorable route has been found, over which a railroad can be constructed, with grades and curves highly favorable, and at a cost much within the average of our eastern roads for graduation. A report is now in preparation, to be submitted to the stockholders on the 9th of December, when will be decided the question of action, which we trust will be both prompt and energetic; as the period has arrived when Kentucky owes it to herself to construct railroads which will open an easy communication from her sea-board—the Ohio—to the interior. The truth is, the people of Kentucky cannot afford to be without better means of transportation and travel.

## New Inventions—of Old Instruments.

The following has been sent us by way of showing that what has been long in use, and of much utility in this country, has been recently discovered in England. Similar discoveries are often made—not only in England, but in this country also.

"BLADE PROTRACTOR. (With an engraving, Plate XVI.) Registered by Mr. James Basire, Jun., of Red Lion Square." Civil Engineer and Architect's Journal, page 310, London.

The above appears to have been entered for patent on 4th August, 1847, as an original invention of Mr. Basire of London, but most of the civil engineers of the United States are familiar with it. The writer of this recognizes it as an acquaintance of long standing, he certainly saw one in 1835, since which he has seen it as an instrument of every day life, in every Engineer's office that he has

visited in the state of New York. Mr. Squire Whipple, of Utica, N. Y., invented it about 1833 or 34, and has since that time improved upon it, though I believe it never has been patented in this country. Probably the improvement will be patented, in a few years, in England, and cut off Mr. Basire's, unless he happen to be the fortunate man to discover it. Yours, D

Shady Side, November 18th, 1847.

## Schuylkill Coal Trade.

PHILADELPHIA AND READING RAILROAD.—Amount of coal transported during the week ending Thursday, November 18, 1847.

	Tons, cwt.
From Port Carbon.....	11,094 03
" Pottsville.....	5,120 02
" Schuylkill Haven.....	12,483 05
" Port Clinton.....	3,202 11

Total for week..... 31,900 01  
Previously this year..... 1,201,566 16

Total..... 1,232,466 17

HENRY M. WALKER,  
Supt. Coal Tr. P. & R. R. R. Co.

SCHUYLKILL NAVIGATION.—Week ending November 31, 1847.

	Tons, cwt.
Pottsville and Port Carbon.....	7,278 00
Schuylkill Haven.....	2,471 01
Port Clinton.....	00 00

This week..... 9,749 01  
Previously..... 211,895 06

Total..... 221,644 07

## Tide Water, Pa., Canal Trade.

"On Tuesday last," says the Philadelphia Commercial List, of Nov. 20, "the steamer Kingston towed to this city THIRTY-FOUR large canal boats, which descended the Tide Water canal to Havre de Grace, laden with full cargoes. This was the largest 'tow' ever brought from Delaware city."

The following articles composed the largest portion of their freight—iron being the most prominent. Pig Iron, lbs.,..... 1,102,000  
Railroad Iron..... 222,942  
Castings..... 99,963  
Lumber, feet..... 267,458  
Shingles..... 360,400  
Staves, bhd. No.,..... 3,950  
" brl.,..... 500

There was not a single barrel of flour or a bushel of wheat in any of these boats. The crop of wheat in the interior of the state is very light and consid-

nable supplies are transported from this city to various points in the interior for grinding.

This is a very different state of things from last year. The business on the Chesapeake and Delaware canal is steadily increasing. During the week ending November 10, at noon, there passed through this canal 970 tons of oysters—also 723 cords of wood.

#### Ten Wheeled Locomotive Engines.

In the early days of railways in England, a rail that weighed 35 lbs. to the yard was a heavy rail—and a locomotive that weighed over five tons, with water in its boiler, was excluded from the society of its fellows on the Liverpool and Manchester road, and not allowed the honor of hauling his majesty, William the IV. at the trial of engines in October, 1829—but things have wonderfully changed during the past eighteen years—what was then a heavy rail has been entirely discarded for locomotives, and locomotives that were then pushed out of good society because they were *to heavy*, are now discarded because they are *to light*. Rails of 50 to 80 lbs. to the yard are now preferred, and locomotives must weigh from 12 to 25 tons in order to come up at all to the spirit of the age. Formerly we should as soon have looked for 6, or 8 legs upon a horse, as for that number of wheels upon a locomotive, but such has been their rapid growth, and such is their enormous weight, that they now have six, eight, and even ten wheels.

It is amusing, as well as instructive, to look back, occasionally, and compare the past and the present. And we will compare a performance upon a neighboring railroad, in July, 1832, with a regular working upon the Reading road in 1847.

We give the following, from the Railroad Journal of July 14, 1832. It is headed "Railroad Experiments," and reads thus.

"*Railroad Experiments.*—Extract from the report of John Randel, Esq., Engineer in chief of the New castle and Frenchtown railroad company's, to the Board of Directors, dated Newcastle, July 4th, 1832, relative to the performance of the locomotive 'Delaware.' This engine is one of Stephenson's make, with Booth's patent boiler, and this is the first effort made with her.

"Yesterday and to-day, says Mr. Randel, I made a trial of this engine between this place and Frenchtown, and have the satisfaction of being able to say it works well. The large radii of our curves—the least being 10,000 feet—will enable us to pass through them without abating its velocity.

"In going yesterday to Frenchtown, we passed through the 5th curve—radius 20,000 feet—with a velocity of 15 miles per hour, and in returning we passed through it at a velocity of 20 miles an hour.

"Although every part of our road is in good repair, yet, to insure safety, the embankments were crossed at a reduced velocity; shutting off the steam before we arrived at them, notwithstanding which we averaged, for the whole distance in going to Frenchtown, *about twelve miles an hour*; and when returning to Newcastle—twelve miles of the distance being performed after dark—we averaged upwards of *ten miles an hour.*"

Such was the performance of one of the first—if not the first—locomotives used in this country—only fourteen years ago, and it was then deemed astonishing; as Mr. Randel says "the shortest period of time within which we passed from one mile post to another was *two minutes*—or at the rate of *thirty miles an hour!*" It was a performance to be talked about—and it *was* much spoken of—but the locomotives of the present day do better than that, as will

be seen by the following statement in relation to the locomotives on the Reading railroad. The "Chesapeake" spoken of is one of Norris' improved ten wheeled engines, of which the accompanying cut is an illustration. It has six driving wheels and weighs 19½ tons, with 14½ tons on the drivers.

Mr. Nicolls speaks of it as follows, in a letter dated May 27th, 1847, in relation to inquiries made as to its performance.

He says—"The 'Chesapeake' has been running for about two months, upon the Reading railroad, doing duty regularly with its other engines, in its coal trade.

"Her performance has been entirely satisfactory. She hauls more coal cars, in proportion to her adhesion, than any other engine on the road. She passes through curves, of any radius, with as much ease as any other engine we have. She is less injurious, in proportion to her gross weight, or to her adhesion, upon the rail, curves and bridges, than any engine hauling coal upon the Reading railroad: from which it follows, that the amount of coal hauled by the 'Chesapeake,' for any given period, is passed over the road with less wear and tear, and risk of accidents to rail and bridges, than by any other engine used upon same road.

"Their comparative weights and trains are as follows, viz:

"The 8 wheel engines in common use weigh 22½ tons, have 22½ tons adhesion, and haul 413 tons of coal.

"The 6 wheel engines weigh 19½ tons, have 19½ tons adhesion, and haul 393 tons of coal.

"The 'Chesapeake,' 10 wheel engine, weighs 19½ tons, has 14½ tons adhesion on her six drivers, and hauls, with as much ease as the other engines, her allotted load of 384 tons of coal.

"I consider that the Chesapeake possesses to a greater extent than any other engine, I have yet seen, the combined qualities of efficiency and ease to the rail and bridges.

I am very respectfully yours,

(Signed) G. A. NICOLLS,

Engineer, etc., Reading Railroad.

After five months further use, having passed over the road more than 130 times, Mr. Nicolls writes as follows, dated "Reading, Pa., October 29, 1847."

"Messrs. NORRIS, BROTHERS, PHILADA.

"Gentlemen:—I have just received your favor of 28th instant, in relation to your Chesapeake engine.

"I have the pleasure of stating that the 'Chesapeake,' 10 wheel engine, built by you for this road, has run since March last, some 13,000 miles, in the coal trade of the road.

"She turns curves with as much ease as any other engine we have, and has proved as safe in keeping the track.

In her performances in detail, as compared with those of other engines, I beg to refer you to my letter of 27th May last, on same subject.

Very respectfully yours,

(Signed) G. A. NICOLLS,

#### Iron Bridges.

We referred, in the Journal of 13th inst., to Mr. Whipple's treatise on bridge building. We have the opinion of eminent engineers in favor of Mr. Whipple's plans and views, from which, and the examination of a small model exhibited to us at our office, and we believe also at the Fair of the Franklin Institute, we are led to form a high opinion of his iron bridges, especially for railroads—and therefore we give place to the following communication.

For the American Railroad Journal.

I wish to make a few remarks upon "Rider's Iron Railroad Bridge" upon the Harlem railroad, a little north of the tunnel, for the purpose of making practical deductions relative to the economy and safety of iron bridges for railroads generally.

This bridge is 70 feet long and about 20 feet wide, has two pair of ways, and is supported by two iron trusses, about 7½ feet high from centre to centre of the upper and lower horizontal ribs or stringers. These stringers are parallel, the upper one of cast

iron, of a T formed cross section, containing about 12 square inches to each truss. It is cast in two symmetrical parts, put together so as to "break joints." The lower stringer is composed of two series of bars or plates of wrought iron, each 4 inches deep by ½ inch thick, placed ½ of an inch apart, to receive ½ inch diagonal bars between them. These stringer bars are spliced so as to "break joints," and at each splicing is a plate 4½ inch, about 20 inches long, with two bolts each side of the joint.

There are vertical struts of cast iron, about 3 feet 4 inches apart, of an H formed section, containing about 8 square inches, extending from the upper to the lower stringer. Two diagonal ties of wrought iron, 2½ in the center, and 2½ at the ends of the truss, crossing one another and pass through a hole in the centre of each vertical strut, being secured to the top and bottom stringers by a bolt through each end. The above are the essential parts of the truss.

I estimate the weight of this structure approxi-

mately at 32,000 lbs., equal (in its effects towards breaking the truss in the centre) to 8,000 lbs. on the centre of each truss.

I also estimate the ordinary freight trains passing over the bridge, at 1000 lbs. per foot; (only half what I am in the habit of estimating the possible load of a railroad bridge). Of this weight, about  $\frac{1}{4}$  is sustained by one truss, the centre of the track being about 5 or 5½ feet from one truss, and some 15 feet from the other. The load of 70,000 lbs., then, is equivalent to  $1\frac{1}{2} \times 70,000 = 26,250$  lbs., in the centre of the truss, which added to the 8,000 for the weight of structure, gives 34,250 lbs.; and one-half of this weight, is the force with which each abutment would react upon the truss, with such a load in the centre.

Now, regarding the centre of the top stringer as a fulcrum, half the length of truss as the average, 17,035 lbs., ( $= 1\frac{1}{2} \times 34,250$ ) as the force; the cohesion of the lower stringer as the resistance, and 7½ feet, (the height of truss from centre to centre of stringers) as the leverage upon which the resistance acts. The following equation gives the tension  $T$  of the lower stringer, in sustaining the load,  $7.5 T = 17,125 \times 35$ . Whence  $T = 80,000$  lbs., very nearly,  $= 20,000$  lbs. to the square inch of cross section, allowing nothing for the portion of the bars cut off by the bolt holes for connecting the diagonals; which cannot be much less than  $\frac{1}{4}$  of the whole. This would increase the tension to 26,666 lbs. to the square inch.

It may be thought that a portion of this truss is sustained by the diagonals. It is clear enough, that in the absence of the lower stringers, the diagonals would receive the strain which otherwise falls on the lower stringer. But as the truss is constructed, when loaded uniformly throughout its whole length, those diagonals only are brought into action which extend upward and outward, in the direction from the centre towards the ends of the truss; and at the centre of the truss, the diagonals running upward and outward as above stated, are connected with the lower stringer some 4 or 5 inches asunder, and consequently cannot relieve the stringer of any part of the horizontal strain.

It may be possible, however, to strain up the diagonals so tight as to produce some relief to the stringer, but such condition of things is not to be depended on. It is manifest that the lower stringer should be adequate to sustain all the horizontal stress occasioned by the uniform load.

It appears then, that a portion of the wrought iron in the bridge in question, is liable to a stress of more than 26,000 lbs. to the square inch, from a dead load on one track, of 1000 lbs. to the foot run, and yet the bridge endures the daily and rapid transit of the trains of the Harlem railroad.

If, then, bridges be built on the plans I have given in my work on bridges, which are estimated to sustain trains of twice the above weight, or 2000 lbs. to the foot run, with a stress of only 10,000 lbs. to the square inch of wrought iron, on any part, instead of 26,000 lbs. as above, or less than  $\frac{1}{4}$  of the stress for the same load, will not the chances of failure be reduced almost beyond the range of possibility, as far as wrought iron is concerned?

I have not time now to pursue this subject, nor is it necessary to my purpose. I only wished to point to the experimental lesson afforded by the bridge here spoken of.

If I have committed any errors in calculation or otherwise, I shall be very thankful to any one who will point them out. I am certainly far from expecting to promote my own interest by continuing in

error myself, or by leading others into error on this subject.

S. WHIPPLE.

Utica, N. Y., Nov. 1, 1817.

#### For the American Railroad Journal. Railway Breaks.

In looking over several of your back numbers, I find that you are trying to impress upon inventors the importance of bringing out some kind of improvement in breaks for railroad cars, so much needed to secure safety to lives and property in railroad travelling. You refer, I believe, to a break, to be under the control of the engineer, and by him applied to a whole train of cars. I have no doubt this might be done, still it must, I think, be attended with such difficulties as will always prevent its adoption; especially as there is no difficulty in making breaks, on the common plan, with sufficient power to hold, and cause all the wheels of a train to slip on the rail. It is only necessary that railroad companies furnish a good breakman, to each car, instead of one or two for six or eight cars, as is usually done—and, indeed, of what use are breaks on each car, if they are not applied when needed. Railroad companies generally dislike to use breaks that will entirely stop the wheels and cause them to slide, and they may well do so, as wheels are thus much injured by having flat places on the tread, giving them a more violent concussion to both wheels and rail, and producing a very unpleasant motion to cars and passengers.

Now, sir, if there is any way to compel railroad companies to increase the number of breakmen, especially on passenger trains, all possible safety can be secured by the use of the old breaks. There is not so much need of a breakman on every car for freight trains, as their speed is much slower. But if any one should be fortunate enough to introduce a break that will be free from objections, it certainly would be a valuable work for the discoverer, and well might he claim the gratitude of the travelling public, while he would see its adoption by all railroad companies.

Yours respectfully,

F. M. RAY.

New York, November 11, 1817.

REMARKS.—The great object, as we conceive, of improved machinery, is to accomplish the desired object in a better manner, at less expense, than in the ordinary way; and therefore it is that we have so frequently called the attention of our readers, among whom we are sure there are many able inventors—to the subject of an improved break, by which a train may be brought to a stand still, if need be, in the shortest possible time, without making any of the wheels slide on the rail—and thus injure, not only the wheel, but also the cars and road, and also without the increased expense to the company, or to the business of the road, of a breakman to each car.

It may be a difficult thing to do,—but it can and must be done—to arrange a break on each car, which shall touch every wheel, and yet be under the control of one man—or two men—not the engineer especially, though it may, perhaps, be so arranged that he may put it in operation, in case the brake-man should be out of his post at the critical moment.

The reason why it is necessary to break a car so hard as to make the wheels slide, is that so few wheels are touched by the break. A train of six passenger cars has 48 wheels, and if each wheel is borne upon at the same time, to the extent of half or two-thirds the power required to make them slide, and the engine properly managed same time,

the train will very soon stand still—though sixteen of those wheels might slide on the rail, and yet not stop the train in so short a distance.

The great object we have in view is to avert danger, and avoid increased expense and we are quite sure it is only necessary that the attention of the right man should be turned to the subject to accomplish the object; and we doubt not he, who ever he may be—will derive more benefit from it, when it shall be accomplished, than did the inventor of the entire railroad system. Small things often yield more profit to the inventor than mighty ones.

#### South Carolina Railroad Report.

This report for 1816, with one or two others, received some months since, has been laid aside until it is almost time to look for another for 1817—it is not, however, too late to bring it into the volume where it belongs, and we therefore now give it a place to keep up the history of this work, which was one of the first railroads brought into use in this country, and for some years the longest line of railroad in the world under the management of one company.

On referring to the volumes of the Journal, we find the first report published by us, in relation to this road, by that accomplished engineer, Horatio Allen, now of New York, was published on the 17th of March, 1832—and the second on the 2d of June, of the same year—of course it is due to it, and to ourselves, to continue its history from year to year, as long as we have the supervision of the Railroad Journal.

It will be seen, on referring to the report, that the earnings of the road were, in 1816, \$30,383 greater than in 1815. The increase of 1817 over the previous year will probably be more than twice that amount.

We are gratified to learn that the wise policy of liberality and co-operation exists between the different lines of railroad in that region—that they "repudiate all idea of monopoly, rivalry and competition," and look upon each "as a part of a common system; the veins and arteries of a great commercial body, animating in the reciprocal circulations of its trade, the whole, and paralyzing by impediments, or restrictions, no portion."

This is as it should be, and we hope to see this wise policy pursued throughout the country.

It will be seen that the Camden branch is in a fair way for completion; and efforts are now making to extend the Columbia branch to Greenville, and the Camden branch to Charlotte, in North Carolina, and thus open a wider field to Charleston. It is, possibly, fortunate that the publication of this report has been delayed until this time, as it will be better understood, and all its connections seen upon the map published by us in this number, to show the importance of an early construction of the line from Wilmington to Manchester, and thus fill up that unseemly gap.

CHARLESTON, S. C., 9th Feb., 1817.

To the Stockholders of the South Carolina Railroad Company:

GENTLEMEN: The board of directors have the honor of presenting to the stockholders their third annual report of the operations of the South Carolina railroad company, for the year ending the 31st of December, 1816.

The gross receipts for freight, passengers and mail service, for the year 1816, was \$558,697 71. The expenditures for same period, embracing ordinary current ex-

penses: additional machinery, improvements on depots, and interest on foreign and domestic debt, was . . . . . 389,148 10

\$169,549 61

Amount of dividends paid . . . . . 147,900 00

Balance applied to improvement of property, . . . . . 21,619 61

From the above, two semi annual dividends of \$2 25 and \$2, making \$4 25, on each share was declared, being within a fraction of 5½ per cent. on the par value, \$75 of the road stock, and leaving as shown, \$21,619 61 applicable to objects as stated.

The gross receipts from all sources for the year 1846, were . . . . . \$589,081 52

The expenditures for same period, including current expenses, additional machinery, improvements on depots: interest account: paving Meeting street, and damages, were . . . . . 418,171 17

170,910 35

Amount of dividends paid . . . . . 140,725 50

Balance applied to improvement of property and reduction of indebtedness, . . . . . 30,184 85

The two semi annual dividends were, for the first half year \$1 50, and the last \$2 50, making \$4 on each share, and equivalent to 5½ per cent. on par value of stock, and leaving an exhibited \$30,184 85, applicable to improvements. The large amount under the general head of expenditures for the year '46 as compared with those of the previous years of 1844 and 1845, may be explained by an appropriation for the improvement of Meeting street, and for damages; particularly in the loss from fire, (supposed to be the act of an incendiary) of a large amount of cotton, while in the cars on the track at Aiken, ready for departure by the downward train the next morning. If these amounts, as in the auditor's comparative statement of ordinary expenses, since the consolidation of the two companies be deducted, we have for the legitimate and unavoidable expenditures, under all the various heads, of current, materials, property, and interest account, \$282,972 31 in the year 1844—279,475 43 for 1845 and 300,672 25 for 1846—showing, as compared with 1844, an excess of expenditure of 17,699 91, against an increased receipt of \$50,210 57: and as compared with the last or previous year, an excess of 21,196 79 of expenditure against 30,383 81 of increased receipts. A considerable portion of this excess of expenditures may be accounted for in the enhanced cost of supplies; in the large amount of materials on hand (as exhibited in the schedule from the master of the work shops;) in preparation for the construction of an additional number of cars; and in the increased expense necessary to preserve the track of the Hamburg road from the injuries inflicted by the heavy locomotives, and the higher speed of the passenger trains. The relative proportion likewise between the receipts and expen-

ditures this year, were greatly disturbed by the low rate (with a view of relieving the suffering planters of the interior) at which the company undertook to transport grains.

Upwards of 250,000 bushels of corn alone the last season, were transported to Columbia, Hamburg and intermediate stations; and at the moderate rate of freight charged, a *portion of it free*, it is apparent that much the largest moiety of the amount was made chargeable in the columns of expenses, while a very small balance was carried to the credit side of receipts. The receipts of the first half year of 1846, which were greatly affected by the reduced crop of 1845, had likewise an influence in disturbing the relative proportions between receipts and expenditures, for by reference to the auditor's accounts it will be seen that of the amount \$589,081 52, received for the year 1846; but 251,741 36 were taken in the first half year, while the last half year, the receipts were swollen to 337,340 16: and under such a pressure on our locomotives, cars and available force, as unavoidably to involve greater expense from the necessity of loading cars and running the trains at night.

The report of the auditor with the accompanying tabular statements, numbered from 1 to 7, exhibits, in a clear view, the state and condition of the property and finances of the company, with its liabilities, assets, etc., for the year 1846; and of the monies received and expended on account of the stock, and on the construction of the Camden branch road. The tabular statements Nos. 4, 5 and 7, exhibit the number of passengers conveyed on the road, the amount of freight, separating that which goes into, from that which comes from the interior, the number of bales of cotton received at each station, the number of packages and pieces of merchandize forwarded by railroad into the interior, and the amount of articles received by railroad for transmission to other places, with a comparative statement in table No. 7, of the income of the road for the last three years (commencing with the consolidation) from all sources, exhibiting the average number of locomotives in active service; their arrivals and departures, with the number of miles run. Appended to these documents is a statement, for the last three months of the year, commencing with the more recent extension of the lines of railroads to the west; from our agent in Hamburg, of the number of packages of merchandize, with the value of the freight thereon, forwarded to the different stations beyond Atlanta in Georgia, where the trade with North Alabama, the Coosa district and eastern Tennessee may be said to commence, with an exhibit of the returns of the same in cotton, grains, western productions and domestics. From these beginnings of a trade, just emerging from the western horizon, the extent of which, in the future cannot be estimated, and must greatly exceed even the speculations of the most sanguine—the stockholders will be the better judge of the facilities, which it is for the interest of this company to continue to afford. In connecting the forwarding, with the other obligations of

common carriers, your direction have been influenced not merely by the example and practice of other companies competing for the same business, but with a view of so cheapening and of so perfecting the means of transportation as to bring not only contiguous points, but even those the most remote, in certain and intimate communication with each other, thus augmenting the transportation on the road as the ranges and circles of commercial intercourse were extended, diverting to, and through Charleston, merchandize and produce which hitherto sought the markets of consumption by other channels; and into which they would still continue to flow, if equal and greater facilities were not afforded by what is now known and designated as the Carolina and Georgia route to the west. The policy pursued has not been without its favorable results on the transactions of the road. As this matter, however, was referred to a committee to report on, your board do not consider any further remarks necessary beyond the presenting, on this occasion, statements and facts for the determination of the maturer judgment of the stockholders.

The report of the superintendent of the road, Mr. Lithgoe, is not as favorable as your direction could have desired. His statements which have been confirmed by the inspections of the president, are: that the track, from the very light iron rail in use on the Hamburg portion of the road, is beginning to suffer from the heavy freight trains, and locomotives, which the increased business has now rendered indispensable. The greater number of passengers in the daily trains, and the higher speed exacted under contract for mail service, and to meet the competition of other travelled routes, have likewise conspired to produce similar injurious effects. The iron rail is wearing daily, and in some instances has become so thin, (though of the flange form) as to be very little superior to the common flat bar, which the South Carolina canal and railroad company found necessary, at a former period, to remove. This subject, in part, was brought to the notice of the stockholders in the last annual report, and the recommendation of importing a certain amount of new rails annually to be substituted for those which were impaired, met with your concurrence; subsequent experience, however, afforded more time for examination; and which accords with that of other railroad companies in Europe and the United States; who, in the first instance, used rails of a moderate weight on their tracks, with the views of Mr. Lithgoe, (under whose daily inspection is brought the effects of heavy weights in rapid motion on a light superstructure,) would favor the policy of preparing at an early date for the gradual substitution of 6 or 10 miles annually of a heavier; for the flange rail now in use, to the extent at least of the main trunk of road from Branchville. This trunk, 62 miles in extent, now sustains the business of both the branches to Columbia and Hamburg, and will soon have added that of the Camden and other roads now projected, with the view of a connection with the South Carolina. Promptness of execu-

tion, certainty and security are the strong recommendations of railways, and if they are not so constructed as to ensure these requirements by the public, the transportation on them will diminish or be executed without satisfaction, with frequent interruptions and at great hazard. The stockholders of the Baltimore and Ohio company, the road of which was constructed, on the lower section from Harper's Ferry, with a light flat bar, have commenced the substitution of an iron rail of a heavier and more servicable weight; and the able report of its engineer, accompanied with valuable statements and calculations of the injury inflicted on iron rails, according to the velocity and amount of tonnage transported periodically over them, demonstrates that in the greater annual expense of maintaining a track with a light rail, the company in the course of time will be amply remunerated for the larger capital, which in the first instance a rail of heavier weight will involve. The experience on that road (which in all its operations is more assimilated to those of South Carolina, than any more to the north of it.) but made more apparent from the heavier amount of tonnage transported than the South Carolina has as yet attained; has been amply confirmed by the report of Mr. Lithgoe. While the maintenance of way on the Columbia road, constructed on cross ties, with a T rail of 57 lbs. to the yard, (though the timber of a considerable portion of the lower section had to be removed,) does not exceed \$160 to the mile—that on the Hamburg road has amounted to \$351—and even at this cost the superstructure in many places, has with great difficulty been preserved in the condition that the interests of the company prescribes. The present iron, (says the superintendent,) embeds itself in the timber, "so much so that the timber has to be removed more from this cause than from decay. I am of the decided opinion that the timber in which the iron lays, on an average will not last longer than three years. If this be the result, is it not a matter for consideration whether it would not be better at once to adopt a heavier iron?" While this subject of defect in the road, and if the remedy necessary is brought to the attention of the stockholders, it is with some satisfaction that the board have to charge the injury sustained and complained of to an increased and continually increasing business, which in requiring a superstructure equal in strength to the tonnage daily exerting its weight and power on it, furnishes in the increased profits of transportation, the adequate means to renew the road, in sections, gradually, as proposed.

The enhanced expense in the maintenance of way; of a superstructure too light and fragile for the weight and velocity of the machines it has to resist, forms but a small portion of the injuries otherwise sustained, in all the varied operations of the road. If the track is weak and defective, and subjected to repeated dislocations; accidents accumulate, delays in the arrival of trains, involving loss of time, become more frequent, damages and forfeitures oftener incurred; and the injury

to machinery in locomotives of a delicate texture and easily deranged, becomes incalculable. In a heavy superstructure therefore, and a firm unyielding road bed, are reliance alone to be had for a perfect railway; adapted to any emergency, and equal to any power or velocity which it may be desirable to apply on it. This subject, therefore, is submitted to the serious consideration of the stockholders, that they may either by a committee, reared for this special purpose, examine into, and devise the means necessary to remedy the approaching difficulties, in the defect of road, anticipated; or devolve on our successors in office, ample power to act in the premises as the interest of the company may recommend. The procuring the labor necessary and required on the different sections of road, by hiring at fair rates, is another difficulty presenting itself. After hands, says the superintendent, for many years in the company's service, have acquired the knowledge and skill necessary to make them valuable, the company are either compelled to submit to higher rates of wages imposed, or to pass others at a lower rate of compensation through the same apprenticeship, with all the hazards of another strike in their turn, by the owners. The difficulty involves the advantages of the policy of owning by purchase the labor necessary for service on the road, or to continue to be exposed to all the hazards of hiring under the present system, and the chances of being raised upon in times of emergency. Mr. Lithgoe reports that ten women and seventy-five young men may be advantageously and profitably employed in the place of many of those now hired; the wages paid for whom, would be a high remuneration to the company, for the capital so invested. All of which views are respectfully submitted to the consideration of the stockholders.

The report of the master of the work shops, and of the agent of transportation, exhibits the state and condition of the property in machinery, the number of cars on hand, the number of locomotives in service and their present value, the number of those disabled but susceptible of repair, and the number which from age and hard usage are unfit for renewal, though portions of their parts may be worked up in other machinery—and the additional number of both cars and locomotives which will be necessary to meet the pressing demands of a constantly increasing business to the satisfaction of the community to be accommodated. This report is very satisfactory as to the service which has been rendered the last year by the company's locomotives, the number of miles performed, and the proportional number of engines compared with the entire number owned by the company, which have been kept in repair and on active duty. It is believed that the performance for the last six months of the year with this limited power, will bear a favorable comparison, with the like number and class of locomotives on any other road. With this report is a statement of the work performed at the smith shop, foundry and car factory. These statements go far to re-

commend the policy of a large addition to both the company's car and locomotive power. It is true economy never to press too severely upon machinery so easily deranged as that on a locomotive, and always to be so amply supplied. No locomotive after performing a trip exceeding 260 miles in extent, should resume her position on the track before a thorough examination, and reported in a proper condition by the master of the workshops. The exigencies of the business of the road, compelling the extra service of a locomotive, when disabled, or not in a proper condition, is always performed at a cost detrimental to the best interests of the company. In England, and on all economically managed railroads, it is considered advantageous to own double the number of locomotives which the actual business of the road may require, so as to afford time for examination, and reparation of all on their return trips, and to be prepared with extras for every emergency, without resorting to unprofitable expedients to meet the unexpected demands of the trade, or of a community for accommodation. *Semper Parati*, is the true motto for the guidance of all railroads, and in accordance with its admonitions, your present directors have made arrangements for such an increase of motive power, passenger and burden cars for the ensuing year, as will, in their judgment, meet the requirements of the road, and with the experience which has been their guide in this case, they recommend the execution to those who may succeed them in office.

The report of the engineer, Mr. McRae, of the Camden branch, shows the present condition and progress of that work, notwithstanding a suspension of operations the last spring for nearly two months, with a hope that the citizens of Sumter might be accommodated by a change of route in the road proposed; and the subsequent summer and winter interpositions of successive floods in the Wateree river, the work has been steadily progressing, and a hope is still encouraged that with the powerful aid of steam, and energetic contractors, the passage of the Wateree river and swamp may yet be accomplished in time to enable the company to press forward, with all practicable dispatch, during the summer and fall months, with the superstructure to Camden. A large portion of the grading along the entire line, is already completed; the whole is under contract; the wooden superstructure with the rails, between the Congaree and Wateree are now in progress. Iron sufficient for the completion of that section has arrived, and if the floods of the Wateree do not interpose any farther obstacles, than those which have already been encountered, the engineers feel confident that all the objects, as to time, in completing the road will yet be realized. But the best devised plans, and the most powerful of human efforts have, at times, to yield to elements which are not to be controlled, and often too powerful, successfully to resist.

Your Board of Directors, with such satisfaction, congratulate the stockholders on the beneficial results of that liberal policy, early

adopted on their part, of extending countenance and credit to all sister roads, having for common objects the bringing the western portions of our Union in more intimate, social and commercial relations with those of the south. The roads in Georgia and Alabama are rapidly and successfully progressing—many of them finished—new roads, penetrating more remote and hitherto inaccessible sections in those and the adjacent states of Mississippi and Tennessee, projected; and companies in progress of organization for immediate and successful action. The road from Chattanooga to Nashville is no longer a problem, and we have every assurance of the most energetic efforts to commence, and push it rapidly to completion. The Hiwassee railroad, opening a communication to Knoxville and the interior of Eastern Tennessee, has been revived, and will receive a new impulse on the completion of the Western and Atlantic to Cross Plains, now only awaiting the daily expected arrival of the iron to finish it. The interior of Alabama is looking with deep interest to a railroad communication between the Georgia and Tuscaloosa, by the Rome branch and valley of the Coosa. Superadded to these, charters have been granted by both of the legislatures of North and South Carolina, and our people everywhere awakening to the importance of rendering more intimate and binding by railroads, the city of Charleston with the interior districts of our own and more northern sister.

The most gratifying symptom, however, in all these movements, is the enlightened spirit by which the projectors seem now to be influenced—repudiating all idea of monopoly, rivalry and competition. We have witnessed with gratification, in a recent convention at Macon, indications of a desire for that concert and union in all these enterprises, by which our southern railroads are to be considered not exclusively state works, but as a part of a common system; the veins and arteries of a great commercial body, animating in the reciprocal circulations of its trade the whole, and paralyzing by impediments, or restrictions no portion. We cordially respond to views so enlightened, and so well calculated, at this time, to stimulate and bring in closer communion, interests, having the common object of prosperity to all.

Respectfully submitted,  
JAMES GADSDEN.

THOMAS WARING, Auditor.

#### Wilmington and Manchester, N. C.

—Or the Connecting Link—RAILROAD.

This break in the line of railroad from Portland in Maine, to the extreme limits of Georgia, has been a fruitful theme of complaint, by travellers between the north and south. It is true, that the people of North and South Carolina have done more to serve the public—or that part of it which travels,—than they have been paid for; yet, notwithstanding what they have done, they have been anatomized for the very little which they have left undone to complete the line of railroad between the Wilmington and the South Carolina railroads. Good steamboats, and the best attention, between Wilmington and Charleston, will never satisfy those who are subject to—or happen to enjoy the pleasures of—sea sickness from an outside—or sea passage.

The inconvenience from sea sickness will be as great, to most persons, from Charleston to Wilmington as to New York, and therefore it is that a new line of superb steamers is to be added to that now composed of the "Southerner" and the "Northerner,"—between those two cities, whereas; if this railroad was now in operation, it is probable that the present line of steamboats would answer for some years yet.

There have been spirited efforts made by the people of Wilmington to open this road. In 1845 and 46 there was much exertion, and a survey was made, and a report published, which exhibits a very favorable route. The distance from Wilmington to Manchester, where it will connect with the Camden branch road, is one hundred and fifty-eight miles—151 of which are straight lines—with grades and curves as favorable as on most other roads in the country—and it can probably be built on terms highly favorable, owing to the make of the land and the abundance of good timber along the line. The estimate of its cost, made by the engineers—which we now give, accompanied with a map showing the line and its connections north to Philadelphia, and south nearly to Alabama and Tennessee—puts down the entire amount, for a single track, depots, and a good outfit of machinery, at \$1,466,000; and the net income for the first year at \$100,760, or over 6 per cent.—which ought of course to increase annually—as business and travel must necessarily increase. We have had this report some time in hand, but the map only reached us a short time since, and we are now able to,—and with much pleasure—present the subject to our readers in such a way as to enable them to see, and feel its importance. They can see its relative position, and the necessity of its early construction.

By examining them a pit will be seen that the Camden branch, which is now in course of construction, and which will probably be extended to Charlotte; and the Columbia branch is now, and has long been, in operation—and which will, beyond all question, be extended to Greenville—will open to this road an extensive region of the upland and most productive part of South Carolina; which, in addition to the thorough and way business, must ensure good returns upon the investment; and, therefore, the people of Philadelphia, Baltimore, Washington and Richmond have a double inducement to give their aid to this work, and especially the merchants of Baltimore and Philadelphia—to whom a wide berth is given by all who go direct from Charleston to New York, by those splendid steam packets. If

the merchants of Philadelphia and Baltimore would secure the visits of southern merchants and business men, they must aid the people of Wilmington, and others laboring in this enterprise, to build this road; they must subscribe to its stock—they must show that they feel an interest in its early completion—they must do as Boston did to draw business from New York. Indeed they have the same inducements for aiding in this work, that Boston had in building the Western road, and has in constructing the Ogdensburgh and the Vermont roads; and, to a certain extent, that the Philadelphia people have in building the central road to Pittsburgh—viz: to make the communication easier with Philadelphia than with other cities.

The amount required from them will be comparatively small—yet very important at the outset, and therefore it is that we desire to recommend this work especially to those who have so direct an interest in it.

The report it will be seen was dated December, 1846: Since then meetings have been held, and stock subscribed, as will be seen by referring to the Journal of July 10th, and August 21st, but to what extent we are not now informed—though we believe that the prospect of an early commencement of the work is quite flattering.

The report is addressed to those who furnished the means to make the survey, and says—

In compliance with your wishes and instructions, a corps was organized and the survey of the route for the contemplated road commenced in July last.

A report upon the survey, together with a map and profile of the route, we beg leave herewith to submit to you.

At the commencement, various schemes were proposed for making the necessary connection with the Wilmington and Roanoke railroad. One to cross the cape Fear, below the junction of the two rivers, with a bridge or steam ferry boat; thence over the swamp on Eagle's island and Brunswick river.

A second, to start from the depot of the road on the hill, and curving around to cross the Northeast at or near Hilton; thence across the point between the two rivers and over the 'Northwest.' And a third, to commence at some point on the west side of the northwest branch of the cape Fear, and above the point at which the Brunswick breaks from it—and from this point the connection to be made by means of a small steamboat.

This last, being decidedly the cheapest; motives of present economy determined us in selecting it as the point at which a line to serve as a basis for our estimates should commence.

Starting, then, at 'Meare's Bluff,' 3 miles above town, the table land being reached at an elevation of 14 feet above tide water, the line pursues a northwesterly direction, for the purpose of avoiding the main body of the Green Swamp and Waccamaw lake, to near Livingston's creek, before reaching which, sufficient nothing being obtained, a change of direction is made. Crossing the creek at a favorable place, about one and a half miles south of the main road, the route, passing a half mile north of the Waccamaw lake, and about one mile south of Whitesville, is continued straight, a distance of 45 miles, to within 2 miles of Fair Bluff on the Lumber river,

a designated point in the line. From thence the route passing about a half mile back of Fair Bluff and crossing the State line 2 miles below it, runs down on the ridge between the Lumber river and Gapway swamp, and crosses the former below the mouth of Ashpole swamp, and near Floyd's ferry. Thence, below the foot of the ridge between Raft swamp and the Little Pedee, and across the latter about one mile above Dr. Gilchrist's bridge, the route follows the ridge between the 'Big Sisters' and 'Maiden Down' bays, and passes about a quarter of a mile north of Marion court house. From thence to the Great Pee-dee river, a favorable point for crossing which is found near the head of Mr. Gibson's dam. Crossing the river at this place, and the river swamp, 2 miles in extent, the route after crossing Polk swamp, follows the ridge between Highhill and Jeffrie's creek, to a point near the road leading from Darlington court house to Ebenezer church. From thence the route is continued straight, crossing Lake and Sparrow swamps, Lynche's creek, Black river, Scape O'er and Rocky Bluff swamps, to a point south of and near Sumterville, a distance of 37 miles.

Thus far the country over which the line has passed, is generally so flat and uniform as to present but little variety, and with some few unimportant exceptions, it abounds in timber of the very best quality for the construction of the road.

The graduation throughout will be comparatively slight, and of easy execution; consisting, excepting where streams and swamps are crossed, chiefly of light embankments, sufficiently high to protect the road from the water that usually remains upon the remarkably flat surface of the earth in wet weather.

From Sumterville, the route passes over a country presenting a similar appearance to that already described, until it reaches Col. John Moore's plantation. Passing about a quarter of a mile to the south of his house, it crosses the head of 'McRae's Mill Pond,' and ascending from this, strikes in Mr. Rees field, the ridge of hills, commencing below Manchester and bordering upon the low grounds of the Wateree river, known as the 'High hills of the Santee.' Passing the ridge at its lowest point, in Mr. Rees field, at an elevation of 316 feet above tide water, and about 175 feet above the Camden branch road, the route, by a continuous curve of from 2000 to 3000 feet radius, with a grade of 50 feet to the mile, and with some heavy excavations and embankments, connects with the Camden road.

Thus presenting a road 158 miles in length of which 151 miles are straight, and the balance, except that immediately at the connection, with curves of over 6,000 feet radius; with fewer heavy grades, and with less excavation and embankment than any road of similar length in the country. It may be proper here to state that we are of the opinion that further examination would demonstrate the practicability of a better route over the 'High hills of the Santee' being found, than the one here presented; time with us being limited, prevented our going into the examination as

minutely as we would otherwise have done.

Before proceeding with the estimates a description of the kind of road estimated for, becomes necessary. The graduation is intended for a single track only, and consists of excavations with slopes of  $\frac{1}{2}$  horizontal to 1 perpendicular; 10 feet wide at grade with side ditches, 5 feet wide at top, 2 feet deep and 2 feet wide at bottom. Embankments 12 ft. wide at grade, and with slopes of  $1\frac{1}{2}$  horizontal to 1 perpendicular.

The superstructure to consist of subills 4 by 10 inches under the bearing of the rails, and bedded so that their upper surfaces shall be two inches below the graded surface of the road, and at their joints resting on cross pieces of similar dimensions. On these the cross ties or sills 8 by 8 and 8 feet long, are placed three feet apart from centre to centre; every other one being notched on its upper surface for the reception of the rail; the alternate sill being brought to a level with the other by being notched on the under side and let down upon the subill. Upon the sills the rails 6 by 7, 4 feet 5 1-2 inches apart, and chamfered on their inner edges, one and a half inches, are placed; being confined to the notched sill by means of a wooden key, and kept in its place on the other by a wooden bracket on the outside of the rail. Over streams and swamps, lattice bridges and trestle work has been estimated for. The former on 'Towns' plan, roofed and weatherboarded to protect them from the weather, and of these there are four, viz: three of one span each, across Livingston's creek, Lumber and Little Pee Dee rivers, and one of two spans, with a draw over the Great Pee Dee.

The trestle work where, as in the Great Pee Dee swamps, it is not over 12 feet in height, is on the plan adopted on the South Carolina roads; the piles being capped and cross braced, with string pieces 10 by 14 in., notched on the caps and secured by means of wooden keys, and on these strings the road laid. In the Great Pee Dee swamp, trestles of the form used on the Wilmington road have been estimated for, in consequence of the height at which the swamp has to be crossed, to protect the road from the action of freshets.

For a road built in this manner, with a plate rail of 2 1-2 by 1 inch, double the weight of that ordinarily used, and consequently costing about \$1400 per mile more; (and that it will answer well for the purposes for which it is intended we think no one can doubt) we present the following estimates, viz:

For excavations and embankments, including grubbing and clearing.....	\$372,581 40
For superstructure, including turnouts.....	854,622 90
For bridging.....	105,935 60
For warehouses and water stations on line and at each end.....	40,000 00
For pay of engineers, including contingencies: (this item depending upon the time occupied in the construction of the road).....	40,460 70
For land damages.....	15,000 00
For 10 locomotive engines.....	70,000
For 8 passenger cars.....	14,000
For 4 baggage and mail cars.....	4,000
For 30 eight-wheel box cars.....	18,000
" flat cars.....	15,600-192,500 00
Add for steamboat.....	15,000 00

\$1,466,000 00

That portion of the road lying in North Carolina, 63 miles in extent, will cost:

For excavation and embankment.....	\$71,958 23
For superstructure.....	340,266 52
For bridging.....	19,570 00
For warehouses and water stations.....	13,000 00
For pay of engineers, including contingencies.....	15,200 00
For land damages.....	4,000 00
For steamboat.....	15,000 00

\$178,994 75

And that portion in South Carolina, 95 miles in extent, will cost:

For excavation and embankment.....	200,623 17
For superstructure.....	514,356 38
For bridging.....	86,365 00
For warehouses and water stations.....	27,000 00
For pay of engineers, including contingencies.....	25,260 70
For land damages.....	11,000 00
Motive power, as above.....	122,400 00

\$1,466,000 00

It will be seen that the route on which the estimates are made, is the one adopted by the convention held at Marion court house, in August last. At that convention a different route was advocated, viz: one to run from Marion court house to Sumterville direct; and its friends were desirous that a survey of it should be made. Our limited time placed this out of our power; a reconnoissance, however was made, and we intended, in compliance with a promise to that effect, to present an approximate estimate of the cost of construction on it; but learning that the charter presented to the legislatures of the two States designates in conformity with the resolutions passed at the Marion convention, the precise route over which the road is to be built, we deemed it unnecessary at present to do so.

#### PROBABLE INCOME OF THE ROAD.

Under this head, it may now properly be considered out of place for an engineer to attempt anything like an estimate, as the importance and value of railroads are so well understood by the people generally; and these estimates are often necessarily made from uncertain data: consequently fallacious, and are therefore justly looked upon with discredit. But in this instance, being enabled to present an estimate based upon information obtained from authentic sources, we may be excused for venturing upon the following, the truth of which those interested can test for themselves.

The number of through passengers between Weldon and Charleston, as ascertained from the books of the Wilmington company, for the year ending 1st December, 1846, was 11,000 which at \$6,

Would amount to.....	\$71,760 00
The freight and way passengers for the same period of time amounted to.....	92,000 00
The mail to.....	37,000 00

\$200,760 00

We honestly believe that the freighting business and way passengers on this road will exceed that on the Wilmington and Roanoke road, at least 25 per cent. in consequence of its passing through a country far more wealthy, more densely populated and consequently having more produce for mar-

ket and requiring more in return in the way of merchandize. And as regards the thro' travel, we feel no hesitation in saying that it will be increased in like proportion, as soon as this road is built; and in support of this opinion, we have only to mention a fact that can be proved by reference to the statistics of all railroads, intended, as this is, as a thoroughfare for travel: that, as in the case of the Wilmington road, this branch of business, as indeed all others, is ever steadily increasing: (see note,) and, in addition, the contemplated road will supply a desideratum long wanted; the connecting link in the great chain of improvements between the north and south.

But to return: Assuming the probable income at what we have above stated as the receipts of the Wilmington road, (of the same length,)

For the past year, viz.....	\$300,760 00
And deducting for management and repairs, a sum which we consider amply sufficient for the first five years, viz..	100,000 00

And we have left..... 100,760 00

Which shows a profit of over 6 per cent. on the estimated cost of the road. And if to this be added the 25 per cent. increase above referred to, it will give us as the net income of the road..... 150,950 00  
Over 10 per cent. on the estimated cost.

#### ADVANTAGES OF THE ROAD.

As to the advantages of the railroad we take pleasure in quoting statistical facts.

To the citizens of Wilmington we would instance the case of the city of Boston, where the multiplication of railroads leading to the city has increased the business of each of the former roads, by giving greater facilities for travel and business, and the fact which we find in Hunt's Merchants' Magazine for November, 1846, a work of undoubted authority, that: For substantial structure, and amount of investments, Massachusetts has taken a decided lead in railroad enterprise; and what was, by many, regarded as a doubtful experiment, has proved a good investment of capital. It appears from the census of last year that the increase of property in Boston, from 1840 to 1845, over that of the previous five years, was nearly equal to the total cost of the railroads of Massachusetts, or about nineteen millions of dollars. From the same source, it appears the import duties paid on goods by the Cunard line of steamers, in '40, was less than \$350 per voyage, or for the 8 voyages of that year, less than \$2800; and the same for 1845, was \$51,000 per voyage, or, for the 20 voyages of the year, \$1,020,000. All the industrial interests of the State have been invigorated and general prosperity promoted. The proceeds of her extensive fisheries and manufactures are carried, with the utmost facility in every direction, to meet the wants of consumers; and form the basis of a greatly increased general commerce.

The total number of passengers carried on the roads that diverge from Boston, in 1845, was nearly 240,000, or double the highest estimate for the trade of the same time by steamboats on the Hudson river, or nearly three times the total population of Massachusetts.

But we need not travel so far as Boston: the citizens of Wilmington have but to look at their own town and they will see an increase of population from 3000, what it was estimated at in 1833, to from 8 to 9000, what it is now estimated at; and an increase in the value of property of nearly 500 per cent.; the value of it being estimated in 1833, at \$310,000, and now, by an estimate made by a committee composed of competent men, its value is set down at \$1,500,000; and this astonishing increase in population and the value of property must mainly be attributed to the construction of the present road leading to the Roanoke river.

To the citizens of the country through which the road will pass, we can only say that all experience in railroads has established the fact that along the line and to a considerable extent on each side, the value of property is greatly enhanced, and the amount of produce made is constantly increased because of the facilities a road furnishes for sending it to market; waste lands are reclaimed, and those under cultivation improved, and the trees of the forest, formerly valueless, are made producers of wealth. With these facts it would not be difficult to prove that the increase in value of property consequent upon the construction of this road would far exceed the entire cost of the work.

Give the people but the opportunity of procuring a fair reward for their labor, and their habits of industry are stimulated, and their enterprise and ingenuity will extort wealth and comforts from sources now wholly unproductive; and with an awakened spirit of improvement, education and intelligence will be found making equal strides.

All of which is respectfully submitted.

JOHN C. McRAE, } Civil  
L. J. FLEMING, } Engineers.  
Wilmington, N. C., Dec. 12, 1846

Gauge, or Width of Track for Railroads.  
Report on the Gauge for the St. Lawrence & Atlantic Railroad. By A. C. Morton, Esq., Chief Engineer.

Continued from page 742.

In some cases they have been so much extended, and the additional length so far removed from the fire box, that it has proved a positive disadvantage. Much of this increased length of tube is inefficient; and from their remote position from the fire add only in a small degree to the evaporating power of the boiler, for the air must be drawn thro' this additional length of tube, giving increased friction and requiring a stronger blast and a serious loss of power. It has been observed on an examination of tubes long in use, that the effect of the heat is visible only on the portion nearest the fire box.

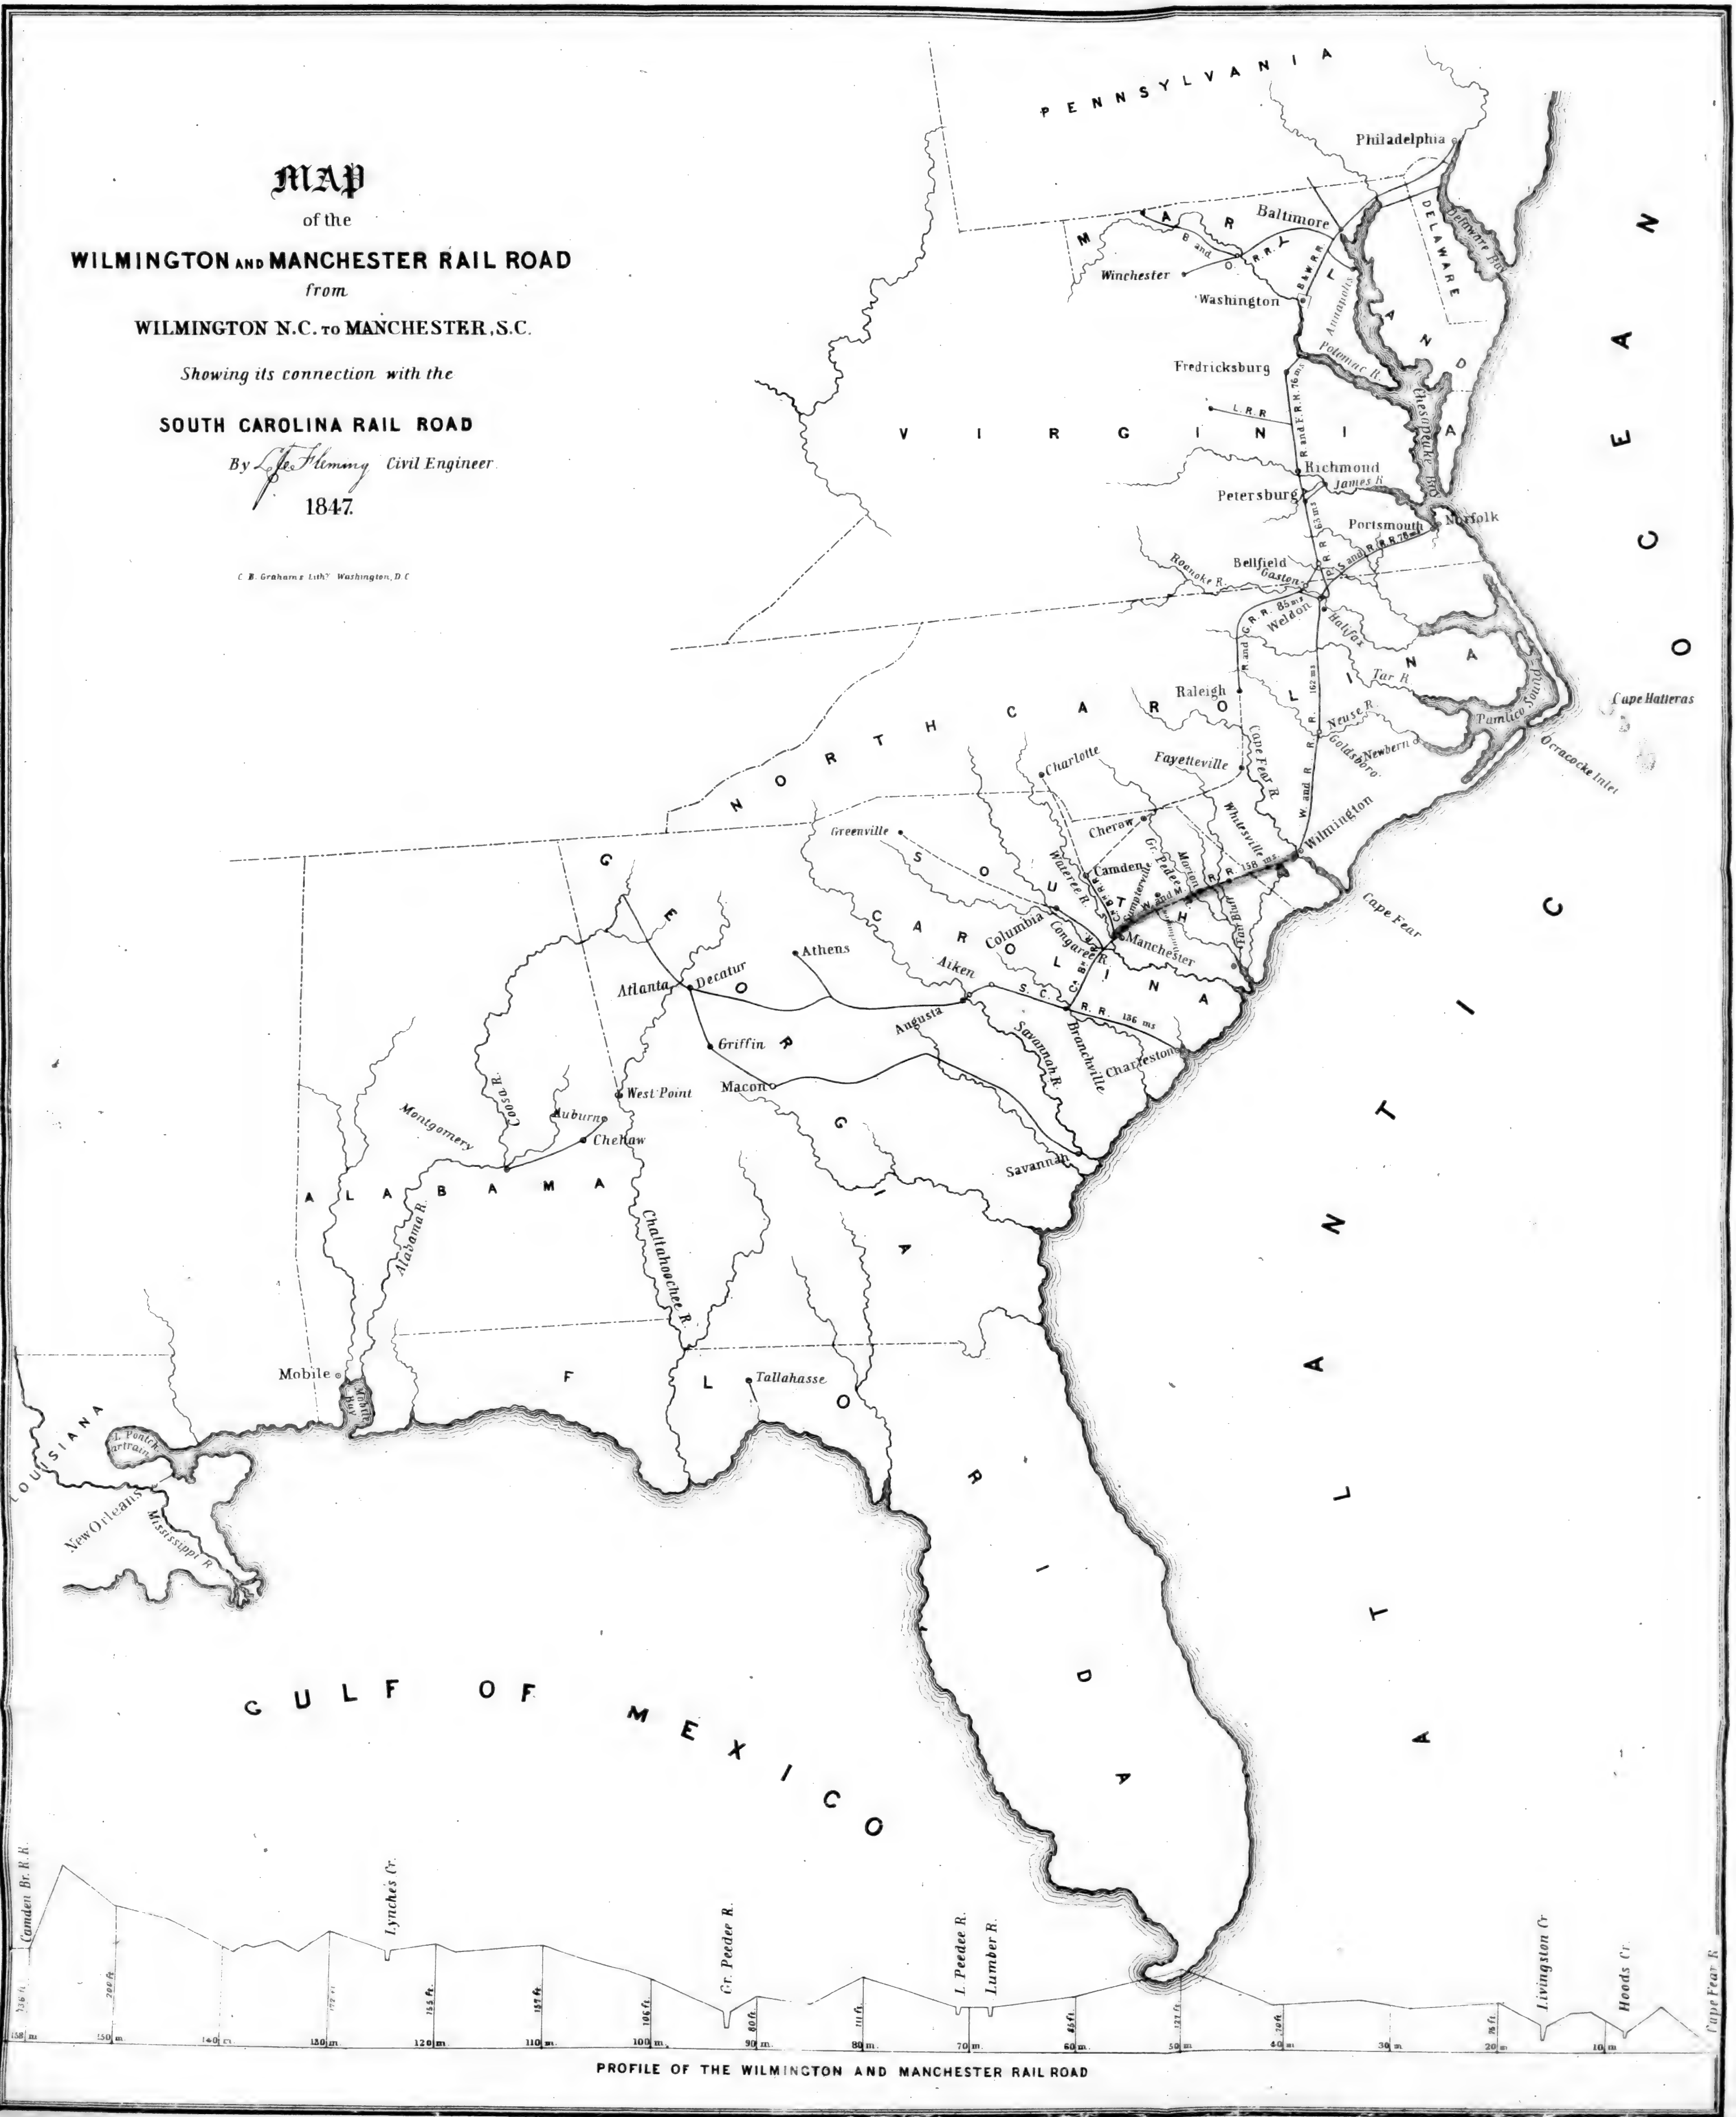

Long tubes are more liable to get out of order or leak, than short ones, on account of their flexibility and the distance between points of support.

This has proved to be the case even with new engines which had been in use but a short time. To remedy this defect, supports have been placed midway of their length; but these have given rise to other evils which are equally objectionable.

**MAP**  
of the  
**WILMINGTON AND MANCHESTER RAIL ROAD**  
from  
**WILMINGTON N.C. TO MANCHESTER, S.C.**

Showing its connection with the  
**SOUTH CAROLINA RAIL ROAD**  
By *John Fleming* Civil Engineer.  
1847.

C. B. Graham's Lith. Washington, D. C.

There can be no doubt that with equal superficial area, short tubes are the best, as they present a larger surface near the fire, are less liable to get choked, or out of order, and require less blast to produce the proper draft through them.

Mr. Stevenson, the great advocate of the narrow gauge, in his testimony before the gauge commissioners, states that they have made the boiler as wide as the narrow gauge will allow; and this is evident from the various expedients resorted to for the purpose of gaining an inch or two in width of fire box. He also states that he has increased the power by lengthening the boiler and fire box;—and that the engines are as large as ought to be put on the present roads.

It should be remembered that the weight and power of engines had been from time to time increased; that roads had been rebuilt, and their parts made stronger, in order to sustain these heavier engines up to the time when it was ascertained that the narrow gauge did not admit of a more powerful engine. Then, and not till then, was it stated that the engines were as powerful and as heavy as ought to be placed on any road.

There is no doubt that if more powerful engines could be built on that gauge, there would be no difficulty or hesitation in providing sufficiently strong roads to sustain them. The commissioners in their report to government, remark in reference to the narrow engines, that they "are as powerful as they can well be made within the limits of this gauge."

Major General C. W. Paisley, inspector general of railways, whose opinions from his position and from his not being an advocate of either the narrow or broad gauge, are entitled to great respect, states in his testimony before the commissioners, that "he does not think the Messrs. Stephenson's opinions of the sufficiency of the narrow gauge of 4 ft. 8½ in. for all purposes has been borne out by the subsequent experience of more than two years. The gauge of 4 ft. 8½ in. does not admit of a boiler of sufficient diameter or of a fire box of sufficient width to give such power to the locomotive engine as is required by the present state of railway travelling.—Mr. Robert Stevenson has attempted to get rid of this disadvantage by lengthening his boiler in the best engines constructed by him, which are also made with outside cylinders. The lengthening of the boilers appears to me to be a failure, since it has not produced engines equal in power to those of the Great Western railway; and some of the engines with long boilers which I have observed by travelling upon them, especially the one called the 'White Horse of Kent,' used on the South Eastern railway, go very unsteadily, oscillating or rolling very much, which, if the speed were materially increased I think might prove dangerous, and which must have a tendency to injure the permanent railway." "As a further proof of the inefficiency of long boilers to obtain the object in view, I may remark that the engines made by the Messrs. Sharp (brothers,) formerly Sharp & Roberts, of Manchester, as well as Mr. Tre-

vetthick, of the Grand Junction railway, at Creeve, and by Mr. John Gooch of the South Western railway, travel as quick as those long boiler engines of Mr. Stephenson's, and much steadier."

From the above testimony, it appears that engines with boilers of ordinary length in use on several roads, had produced as great results and attained as high speed, with less oscillatory motion, than the engines with long boilers. It appears further, although the advocates of the narrow gauge had asserted that it affords all the room necessary for sufficiently powerful engines, yet, a great effort had notwithstanding been made to add still further to that power, but with, to say the least of it, doubtful success.

The attempt to give engines on the narrow gauge increased power by lengthening the boiler may be regarded as a failure; and no means have been suggested whereby it is likely to be accomplished, except that of increasing the diameter of the boiler, and the width of the fire box. A wider gauge will undoubtedly afford space for these changes, and lessen the irregular motion of the engine and its liability to run off the track.

The power of an engine is in proportion to the extent of its evaporating surface, or perhaps more correctly in the language of Mr. Stephenson: "The power of the engine, supposing the power to be absorbed, may be taken to be directly as the area of the fire grate or the quantity of fuel contained in the fire box."

Increasing the size of the boiler or fire box so as to bear the same proportion to a 5½ feet track that those of a narrow gauge engine now do to 4 feet 8½ inches, would add to the extent of heating surface nearly 25 per cent.

This allows an important increase of power which will lessen the cost of transportation, and will prove highly beneficial in other respects.

There is always an advantage in having a large boiler and fire box; and although it may not be necessary at all times to use the power to the full extent, yet the same result may be obtained with greater economy, and less intense heat, consequently less injury to those parts of the engine which are so soon destroyed by fire.

The repairs of locomotive engines constitute a large part of the expenditure for power—and these repairs are required mainly on those parts exposed to the injurious effects of great heat. To work an engine economically, the boiler should never be forced by a strong blast, but the draught should be such as to produce only the amount of steam that may be applied usefully.

There is an advantage in being able to call into action the increased power, which is at command with a greater extent of heating surface and equally intense heat, for the purpose of more readily overcoming the greater resistance on portions of the road where steeper gradients prevail, or where storms of sleet and snow may have been unexpectedly encountered.

The latter difficulty is often experienced on northern roads, and more powerful engines

will be found of the greatest importance as regards economy and punctuality.

The utmost punctuality is required in the running time of trains, more particularly so on roads having but a single track where trains must pass each other at given points. A large number of the roads in the United States have but one track, and very many of the accidents on these roads result from not running to time. Delays are occasionally unavoidable, particularly with freight trains, and more powerful engines will often be capable of making up lost time, and at all times to run with greater regularity and punctuality.

But there are other and more important reasons in favor of more powerful engines. The revenue of the road is in direct proportion to the freight and passengers carried.

The effect of engines of great power is to increase the tonnage of each train, thereby with a given amount of traffic to reduce the number of trains and the number of engines required to do the business of the road.

The expenses of a road are, nearly as the miles run; therefore the effect of transporting an equal amount of tonnage with a less number of trains is an increase of net revenue.

An engine capable of drawing 20 tons of net load more than another, will, applying an average charge of 14 pence per ton per mile, increase the earnings 25 pence for each mile run; and, allowing that your freight engines will run 300,000 miles per annum, the increased earnings by adding this amount to the average loads will be £31,250 per annum: that is nearly 50 per cent. of the whole cost of running freight trains this distance.

By adding to the power of the engine, a much larger business may be done with but a small increase of cost. Many of the expenses of locomotive power are the same whatever the power of the engine. The cost of engine men and fire men, the proportionate expense of superintendence and management, the cost of oil, etc., are the same. The cost of repairs of engines do not increase in proportion to the power or the loads drawn, but, nearly as the miles run.

As it regards fuel, it may be observed that it varies with the load, but the ratio is modified somewhat by the amount consumed in getting up steam and in standing at the station. A large engine working to the full extent of its power, as a matter of course, consumes more fuel than a small one under the same circumstances. This is the only item of increased expense, and this is fully reimbursed by diminishing the delays, accidents, and extra labor attending the use of a greater number of engines. The gauge commissioners admit this, and state decidedly that economy is in favor of large engines when working at their full power.

On many narrow gauge roads it is customary to use assistant engines to a great extent, and on the London and Birmingham road, nearly 29 per cent. of the whole number of miles run by passenger trains during the half year ending June, 1845, were with two engines to each train.

To be Continued.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.** Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 12 in culm and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER PRESS.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**

Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents.**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

**CHILLED RAILROAD WHEELS.—THE** undersigned are now prepared to manufacture their Improved Corrugated Car Wheels, or Wheels with any form of Spokes or Disks, by a new process which prevents all strain on the metal, such as is produced in all other chilled wheels, by the manner of casting and cooling. By this new method of manufacture, the hubs of all kinds of wheels may be made whole—that is, without dividing them into sections—thus rendering the expense of banding unnecessary; and the wheels subjected to this process will be much stronger than those of the same size and weight, when made in the ordinary way.

**A. WHITNEY & SON,**

Willow St. below 13th,

Nov. 10, 1847. [if.] Philadelphia, Penna.

**DAY, CROSKY & ROSS,**

PASSENGERS, SPECIE, GOODS, PARCELS, etc.  
To all parts of the United States, North and South America, West Indies, India, (overland or otherwise,) Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

**ROBERT GRACIE.**

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**

Willow Street Wharf,

Philadelphia, Pa.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by **JOHN A. ROEBLING, Civil Engineer,** Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

93v117

# FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Eliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

**FRENCH & BAIRD.** N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

\*, The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP** and Boat Spikes. The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

**JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,** Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,994 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 = \$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 = 57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge. =	600 00

Cost of one mile including the laying of the Rail. \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331

### LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1925

28 Platt street, New York.

### RAILROAD IRON.

**MOUNT SAVAGE IRON WORKS**

THIS Company are prepared to execute orders for Railroad Iron, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 1917 Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1910 near Third,

below Walnut,  
Philad's phia.

road Depots, etc.

West Troy, May 12, 1847.

**THE SUBSCRIBER** has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Rail-

road Depots, etc. ANDREW MENEELY.

1921

**PIG AND BLOOM IRON.—THE SUBSCRIBER** is agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of iron is solicited by

A. WRIGHT & NEPHEW,

121 Vine St. Wharf, Philadelphia.

**RAILROAD IRON.—THE "MONTGOMERY"** Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents.

1918

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Flooms and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 19

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER HAVING RECENTLY FORMED A BUSINESS CONNECTION IN THE CITY OF NEW

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, trolley ropes, &c. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.				HEMPEN ROPES.				CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.		Circumference of rope.	Weight per fathom.			Weight per fathom.	Diameter of iron.	
	INCH.	LBS.	OZ.	INCH.	LBS.	OZ.		LBS.	INCH.	Tons.
11	4½	13	5	10	31	—		50	15-16	20
13	3½	9	3	8½	16	—		27	11-16	13½
14	3	6	11	7½	12	8		17	9-16	10½
15	2½	5	9	6½	9	4		13½	1-3	7½
16	2¼	4	3	6	8	8		10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearings and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Mellon st.

Office, No. 3 North 5th street,

1y25

Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents the engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

Reading, Pa.

1y45

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa. October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,] T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transport. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,] JOHN LEACH,

Jamaica November 12, 1845.

## THE SUBSCRIBERS, AGENTS FOR

the sale of

Codorus

Glendon

Spring H. J. and

Valley,

Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay for orders for which are promptly supplied.

SAM'L KIMBER & CO.,

59 North Wharves,

Jan. 11, 1846.

[1y4] Philadelphia, Pa.

## TO RAILROAD COMPANIES AND MANUFACTURERS OF RAILROAD MACHINERY. THE SUBSCRIBERS HAVE FOR SALE

Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

45 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 6 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

 New Jersey Malleable Iron Co., Newark N. J.  
 Gardiner, Harrison & Co. Newark, N. J.  
 25,000 to 30,000 made weekly.

**T**HE NEWCASTLE MANUFACTURING Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. **ANDREW C. GRAY,** 445 President of the Newcastle Manuf. Co.

**R**AILROAD IRON AND LOCOMOTIVE Tyres imported to order and constantly on hand by **A. & G. RALSTON** Mar. 20th 4 South Front St., Philadelphia.

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 1½ to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOE CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom.

**S**PRING STEEL FOR LOCOMOTIVES, Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,

Albany Iron and Nail Works,

**T**HE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK &amp; CO.,

Philadelphia.

ROBERT NICHOLS, Agent,

No. 79 Water St., New York.

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

J. BALL &amp; CO.

**C**ONNECTION BETWEEN THE BOSTON and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains between the two roads, will run as follows, viz:

Leaving Lowell at 7, 11 1-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m. to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland. **WALDO HIGGINSON, Agent**

**PATERSON RAILROAD** Summer Arrangement.

Commencing April 20th, 1847, the cars will leave Paterson at New York at  
 8 o'clock a.m. 9½ o'clock a.m.  
 11½ o'clock a.m. 12 1-4 o'clock p.m.  
 4 o'clock p.m. 5½ o'clock p.m.  
 On Sunday.  
 8 o'clock a.m. 9½ o'clock a.m.  
 4 o'clock p.m. 5½ o'clock p.m.  
 Office 75 Courtlandt St.

**BALTIMORE AND OHIO RAILROAD.**

**MAIN STEM.** The Train carrying the Great Western Mail leaves Bal-

timore every morning at 7½ and Camberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburgh and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Camberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Browns-ville and Pittsburg. Time of arrival at both Camberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburg \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburg \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13½

**LITTLE MIAMI RAILROAD COMPANY.**

Fall and Winter Arrangement, 1847. On and after Monday, September 30th, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Yellow Springs, and Springfield. Returning, will leave Springfield at 4½ a.m. Upward train arrives at Springfield at 2½ p.m. Downward train arrives at Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore & Co. are running the following stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheeling, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanesville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine & the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, is 32 hours. Distance from Cincinnati to Springfield by railroad 84 miles.

From Springfield to Bellefontaine by stage, over a good Summer road 32 "

From Bellefontaine to Sandusky city by railroad 102 "

Fares—From Cincinnati to Lebanon \$1 00

" " " " Xenia 1 50

" " " " Springfield 2 00

" " " " Columbus 4 00

" " " " Sandusky city 7 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at a passage for every \$500 in value over that amount.

W. H. CLEMENT, Sup't.

**BALTIMORE AND SUSQUEHANNA RAILROAD.**

Reduction of Fare. Morning and Afternoon Trains between Balti-

more and York.—The Passenger trains run daily, except Sunday, as follows:  
Leaves Baltimore at 9 a.m. and 3½ p.m.  
Arrives at 9 a.m. and 6½ p.m.  
Leaves York at 5 a.m. and 3 p.m.  
Arrives at 12½ p.m. and 8 p.m.  
Leaves York for Columbia at 1½ p.m. and 8 a.m.  
Leaves Columbia for York at 8 a.m. and 2 p.m.

**FARE.**

Fare to York ..... \$1 50  
" Wrightsville ..... 2 00  
" Columbia ..... 2 12½  
Way points in proportion.

**PITTSBURG, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburg via stage to Harrisburg ..... \$9  
Or via Lancaster by railroad ..... 10  
Through tickets to Harrisburg or Gettysburg ..... 3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owning's Mill, arriving at the Mills at 5½ p.m.  
Returning, leaves Owning's Mills at 7 a.m.

D. C. H. BORDLEY, Sup't.

31 1y Ticket Office, 63 North St.

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m. and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1 25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35 1y

**CENTRAL AND MACON AND WESTERN RAILROADS, GA.**

These Roads with the Western and Atlantic Railroad

of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad ..... 190 Miles.

Macon to Atlanta—Macon and Western ..... 101

Atlanta to Oothcaloga—Western and Atlantic ..... 80

Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope,

Butter, Cheese, Tobacco,

Leather, Hides, Cotton

Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings ..... \$0 50

Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones ..... 0 50

## FRANKLIN HOUSE,

No. 103 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,

D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

103 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## A WORD WITH THE MANY.

In our last we had "a word" with a few of our friends, and we now wish to have a few words with the many who have remembered us in a business way, during the year, by which we have been able to sustain the Journal, and make it, in some measure, useful to the cause. For having been thus remembered—as well as for the many kind wishes expressed, and favors rendered—we shall endeavor, by devoting our best energies to the Journal, to make returns which will be more useful, and therefore more acceptable, than the expression of the grateful sense which we feel to all, but more especially to those who have stood by us through all the changes and reverses of the past fifteen years.

The Journal may be made far more useful than it has been—or is—if those gentlemen of the profession, and those connected with the great interests to which it is mainly devoted, will give to it occasionally the result of their experience, and observation; and to them we look, in more ways than one, for aid in sustaining and conducting it. Shall we be disappointed? or shall we find them ready with their pen, in contributing to its columns—and active with their influence in extending its circulation among those who may find it useful, and therefore ought to have it? These are the ways in which all can aid in

making it more useful to themselves, to the cause, and to us—and therefore we shall not be disappointed in our anticipations.

## A WORD TO ALL.

**For Missing Numbers.**—We again remind our subscribers that we shall cheerfully supply missing numbers for the current and past volumes—if we have them to spare—on receiving a list. It is much more easy to supply them now than at any future period.

If we have omitted to comply with any of the applications heretofore made for missing numbers, it has arisen from inability at the time—not from indisposition—it may therefore be worth the labor of furnishing a new list, as we have received many loose numbers of back volumes, from which they may possibly be supplied.

## Wilmington and Raleigh Railroad.

We find a notice of a meeting of the stockholders of this road, in the Wilmington Chronicle of 17th November. The principal business of the meeting was to elect directors and officers, as follows:

Alexander McRae, E. B. Dudley, P. R. Dickinson, Gilbert Potter, James T. Miller and Wm. A. Wright were elected directors, and Gen. Alexander McRae was re-elected president for the ensuing year.

The following resolution was also adopted, viz: **Resolved,** That the stockholders of the Wilmington and Raleigh railroad company, in general meeting assembled, do hereby pledge to the Wilmington and Manchester railroad company, a subscription of \$100,000 to be paid on the completion of said Wilmington and Manchester railroad, from the proceeds of sale of steamboats and other property, which will at that time become unnecessary for the purposes of this company: *Provided,* That our legislature take such action as to authorize such subscription.

This is well—and we trust that it will accelerate the movements upon the road to Manchester.

## Niagara Falls Suspension Bridge.

The suspension bridge companies have decided on the construction of the bridge for the passage of railroad trains. The strength of the supporting cables is to be not less than 6500 tons. The cost is not to exceed \$190,000; and the work to be completed by the 1st of May, 1849. Charles Ellet, Jr., Esq., of this city, has been appointed the engineer. The bridge will be in sight both of the cataract and the whirlpool, and span the gorge by an arch of 800 ft.—suspended 230 feet above the surface of the Niagara river.

## Reading Railroad.

How few of those who are benefited by this noble work, are aware of its importance, and justly appreciate its agency for good. It is known, by many people, in various parts of the country, that there is a railroad extending from tide water on the Delaware, to the coal region in Schuylkill county—called the *Philadelphia, Reading and Pottsville railroad*—better known, however, as the "*Reading railroad*," from the circumstance that it was completed, and in operation, to the flourishing borough of Reading, for a considerable time before it was extended to the coal region.

This road, it is well known to many, was got up as a competitor, with the Schuylkill Navigation company, for the coal trade; it has therefore had, from its commencement, a powerful rival—and to fight its way into use and into favor against large odds—and not only so, but to contend, for a series of years, with still greater difficulties, in the general depression of business from 1837 to 1843, when it was first opened to the coal trade. A lack of capital, and a loss of credit, during the years 1840, '41 and '42, had the same withering influences upon its operations that are produced to individual enterprise by similar causes; and the wonder to us is—not that the company have done what they have—but that they have succeeded at all. There is, however,

one prominent reason that they have succeeded as they have done, under all their difficulties: and that is, in their looking forward to the ultimate certain success of the work, if it should be completed, regardless, almost, of the present outlay, upon a scale of sufficient magnitude.

With this distinct object in view, the company has gone on, regardless of the constant attacks upon its management, until it is now able to bring down, this year, about 1,400,000 tons of coal, which will produce a gross income of near two millions of dollars, besides the receipts for ordinary freight and passengers—which will not be much less than \$400,000—for the current year.

By this determined perseverance, the company has been able to put, and keep, the road in condition to perform more service than any other railroad in use, either in this country or in Europe; and, at the same time, by the amount of coal it brings to market it effects a saving to the consumers of that indispensable article, of at least one dollar on each ton of coal consumed east of the Allegheny mountains—or at least \$3,500,000 per annum! Such are the effects, and the benefits, of the "Reading railroad," within five years of its extension to the coal region; when it has only two cars, and seventy-five locomotives and five thousand tracks! Who will estimate its benefits, when its capacity and ability shall have been doubled, as must be the case within the next few years, when it will be required to bring double the amount of coal and other freight that it now does to tide water? There are few, not familiar with the details of such matters, who can form a correct estimate of the extent of its operations.

The cost of its locomotives alone exceeds \$550,000! and its cars, over \$1,200,000! and its depots, engine houses and machine shops, cannot fall much short of \$1,500,000 more, making an outlay of about three millions two hundred and fifty thousand dollars, for depots and machinery alone, after the immense outlay for the road itself!!!

We were forcibly impressed, when recently on a visit to the coal region, with the correctness of the views of the managers of the road, in thus providing for a large and rapidly increasing business. In rambling about for the purpose of ascertaining what had been done by the two rival companies, at what may be termed the "head of navigation"—but not at the head of "locomotion"—we came across, at "Port Carbon," an engine house, with an immense turntable, and "stalls" for twenty-one locomotives under one roof; and immediately adjoining is to be a shop for temporary repairs of locomotives and cars. This establishment is near the junction of the Schuylkill valley and Mill Creek railroads, at Port Carbon, and therefore in the midst of that portion of the coal region. That part of the road between "Mount Carbon"—the termination of the Reading railroad proper—and "Port Carbon," winds along, at the base of the mountain, and above the canal, with a rapid descent from the latter; and the scenery, when enlivened by the music of the locomotive, followed by a long train of cars, descending those heavy grades at a rapid rate, is peculiarly beautiful and interesting.

The branch roads, or rather the distinct roads, diverging from the "Reading," and extending into the different coal regions in different directions, are, in the aggregate, nearly equal in extent to the main line, and they will, in a few years, be much greater.

The principal of these branches is the Minehill and Schuylkill Haven road, 11½ miles, and its several branches of 15½ miles, making 27½ miles terminating at Schuylkill Haven, over which has been

transported this year 500,000 tons of coal, mainly by horse power, as locomotives were only introduced upon it in August last. The grades upon this road are such that the empty cars returning are about equal to loaded cars descending.

The Minehill coal sustains a very good reputation with consumers, and the extent of the veins and the facilities for mining it, are said to be at least equal to any part of the Schuylkill region now worked, consequently there are several villages springing rapidly into existence, the principal of which is Minerville, which has an industrious and enterprising population of about twelve hundred, with several stores and mechanics' shops, to supply their wants. The principal, or most extensive shops, are those of the Messrs. De Haven, who commenced, a few years since, in a small blacksmith shop—but have now a foundry, with extensive shops for building steam engines, and other machinery required in the coal region; and they have recently, we are informed, commenced the manufacture of locomotive engines.—Thus we see how rapid is the progress, and wide the extension of business in this country, in consequence of the introduction of railroads.

The amount of tonnage upon the Reading railroad will be, this year, probably five hundred thousand tons greater than on any other railroad in the world: and the annual increase upon it hereafter will be greater than upon any other road, for the reason that the increased demand for coal, together with the increase of other business attendant upon the coal trade, and the opening of a road from Pottsville through to the valley of the Susquehanna, will ensure to it a business not only unequalled, but unapproachable by any other railroad now in use; and the time will come when those who projected, commenced and carried this work through its difficulties, will be considered as public benefactors, notwithstanding the prejudice of those who could not appreciate its usefulness, nor foresee its wonderful influences.

#### Postoffice Department and the Railroads.

We called the attention of our readers, in a recent number of the Journal, to the controversy between the postoffice department and the Richmond, Fredericksburg and Potomac railroad, and steamboat company, in relation to the transportation of the mail between Washington and Richmond. We then gave the resolutions of the company, assigning their reasons for declining to accede to the offer of the department. Since that publication, we have received a copy of the correspondence between the department and the railroad company, commencing March 30, 1847, and continued at intervals up to November 23.

The correspondence discusses the laws of 1838, 1839 and 1845, in relation to mail transportation on railroads. The postmaster general fixing his rates per mile, of \$237 50, for first class routes by section 2d of the act of July, 1838, in which says:

"And be it further enacted, That each and every railroad within the limits of the United States, which now is, or hereafter may be completed, shall be a post route, and the postmaster general shall cause the mail to be transported thereon, provided he can have it done on reasonable terms, and not paying therefor, in any instance, more than twenty-five per centum over and above which similar transportation would cost in post coaches."

In one of his letters, the postmaster general says, in speaking of this section—

"What was meant by the cost of 'similar transportation' in coaches? Did it mean the cost of service on the coach routes over the roads then superseded by railroads, or in the same section of the Union, or in the United States? Was the size of mails and the speed with which they were carried,

to be taken into the estimate? The cost of coach service in different sections of the Union varied from \$190 per mile per annum to \$40, depending on the size of the mails and the speed with which they were taken."

"The department finally settled upon and adopted the highest coach service in the United States, paying 25 per cent. thereon, as the maximum for daily service on the railroads. That service was on the road from Wheeling to Cumberland, over the mountains, costing \$190 per mile per annum, and 25 per cent. added to that, made the sum of \$237 50 per mile per annum."

We should naturally suppose that reference was had, in the words "similar transportation," to the route to be superseded by the railroad.

In the act of 25th January, 1839, is the following,

"Be it enacted, etc., That the postmaster general shall not, by virtue of the authority vested in him by the 2d section of the act, entitled 'An act to establish certain post routes and discontinue others,' approved 7th July, 1838, allow more than \$300 per mile per annum to any railroad company in the United States for the conveyance of one or more daily mails upon their road. Provided, that nothing in this act contained shall be construed as in any way to remove or impair the limitations upon the power of the postmaster general imposed by that section."

From this section it appears that, under certain circumstances, the department is allowed to pay, not to exceed, \$300 a mile for one or more daily mails upon railroads, from which it will be seen that the amount of \$237 50 per mile, fixed by the department, is one of its own decisions, rather than a rate fixed by law.

The P. M. Gen. does not appear to estimate very highly the advantages of speed and certainty in the transportation and arrival of the mail, though he says it is better for mail transportation than any other; but places a high value on the concessions of congress to railroad companies, in the remission of duties on railroad iron, as will be seen by the following extract from one of his letters. He says—

"The adjustment of the compensation to railroad companies has always been attended with trouble, owing mainly to the nature of the service; better for mail transportation than any other, and of a character not to admit of much competition. The advance by the government to them of more than six millions of dollars, by the remission of duties on railroad iron, the public convenience, or any other consideration, could prevent them from exacting from the postoffice department such extravagant prices, that congress was compelled to interfere, and in the 3d section of the act of the 7th July, 1838, the postmaster general was prohibited from paying them more than 25 per cent. over and above what similar transportation would cost in post coaches."

It will hardly be denied, we think, by any intelligent person, that the remission of duties on railroad iron was one of the best investments the government ever made; and the following extract from the report of Mr. Spencer, secretary of war, of December, 1841, shows that it has been so estimated by able men connected with the government, whatever may be the opinion of Mr. Johnson. The report says:

"In every point of view in which these works can be considered, their cost is so much actually added to the defensive means of the nation without any expense to the general government, other than the subscriptions it has authorized to a few of them; and it may be affirmed without exaggeration that the aggregate in saving in any future war in which we may be engaged, in the comparatively small amount of military force that will be necessary for defence, and in the cheapness of transportation afforded by railroads and canals now in existence, will be equal to their cost of construction."

If this is not good evidence that the government is, and will be, fully compensated for all it has done in aid of internal improvements, we will add our own to it, and say that it is our candid opinion that the government would have made a good investment

If it had aided the railroad interest to the amount of one hundred, instead of six, millions of dollars.

It appears from the letter of the postmaster general, dated June 24th, 1847, that he thinks his predecessor exceeded "the maximum of the law" in some of his contracts—as he says:

"When I came into the department I found the service adjusted in them by my predecessor, and good faith in the department to the contractors required payments to be made upon the terms settled by him—hence payments have been made in the different sections, and will so continue to be made, whether contracts are executed or not, until the close of the contract term. Then it becomes my duty to re-adjust the service, within the maximum of the law.

"The contracts on the road between this and New York will yet continue a year, and the service will be then re-adjusted; until then it will continue as regulated by my predecessor."

We may therefore conclude that there is to be a general cutting down of the rates on other lines as their contracts expire.

Possibly this may be good policy, and it may contribute to the convenience of the people, and the prosperity of the department, but we think very differently.

We hold that the laborer is worthy of his hire, and that increased speed and increased labor in the transportation of the mail, are entitled to an increased compensation.

The service which A. rendered at four miles an hour, ought not to be required of B., who has expended a million of dollars to attain a speed of sixteen or twenty miles an hour, and certainly, under all circumstances, at the same, or a comparatively small increased, compensation. If speed and certainty are of value to the business community, and to the government, that community and government ought to be willing to pay a fair price to enterprize for it, and not allow their agent to sacrifice the general interest to carry out his arbitrary rules, and to gratify his personal feelings.

Speed, certainty and regularity, are all-important in a business community—and there is no means now in operation by which the business community can be as well served as by railroads—and these railroads have cost immense amounts of capital—therefore those who use them must, of course, contribute a fair return to their support; and who so well able as the government—which derives a benefit in its military operations alone, "equal to their cost of construction," to say nothing of its mail service performed at three, four and five times the speed, and much greater certainly, at only 25 per cent. increased cost?

We again repeat that compensation for mail service should be in proportion to its speed and certainty. The department used to pay more for six, than for four miles an hour, and still more for ten than for six miles—so of course should it pay more for twenty miles than for ten—and still more for thirty or thirty-five miles than for twenty, or there will be no inducement for incurring additional expense to increase the speed on the main lines.

This is not a question between the department and the Richmond, Fredericksburg and Potomac railroad and steamboat company—but between the postoffice department and the railroad interest generally—while the people, the business community, are to be the sufferers: therefore, it is important that the whole subject should be referred, at an early day, to congress, for its consideration and regulation, that the mail service may be properly performed, the business community faithfully served, and those who, by a large expenditure of capital and constant vigilance, perform the service fairly paid.

#### Correction of Railroad Table.

*South Carolina Railroad and its Branches.*

*g* The Main road, from Charleston to Hamburg, has what is termed a flange rail—the flange turning down on the inside of the longitudinal wooden rail—weight, that first used, 25½ pounds per yard, but the new rail, of the same form, weighs about 40 lbs.

*i* A single track, five feet gauge.

*j* One inclined plane.

*k* Highest grade 25 feet.

*m* Fare, 5 cents per mile.

*n* They commute both with families and individuals.

The Columbia branch was opened 17 miles in 1840, and the entire line in 1842, and is 67 miles long.

*g* Has the H rail, 57 lbs. per yard.

*i* Single track, five feet gauge.

*k* Highest grade, 39-6 feet.

*l* Least radius, 2865 feet, except one at the junction.

*m* Fare, 5 cents per mile.

*n* Commutation as on the main line.

The Camden branch is now under construction, commencing at or near the point, we believe where the Columbia branch crosses the Congaree river, and extends to Camden, 37 miles.

*g* The  $\Pi$  or bridge rail, weighing 45½ lbs., and the H rail, weighing 51 lbs. per yard, are to be used.

*i* Single track of 5 feet gauge.

*k* Highest grade, 24-4 feet.

*l* Least radius, 2865 feet, except at junction, and the fair and regulations will probably be the same as on the main line and Columbia branch.

The total amount of stock and debts was, in 1845, \$5,671,452, for the main line and Columbia branch, making together just 200 miles. The Camden branch is not yet completed, and its cost is not included in the above.

The inclined plain at Aiken is half a mile long, and rises 176 feet.

In 1845 the total receipts were.....\$558,698

And the ordinary expenses.....\$281,902

Interest on funded debt.....116,395

Dividends, 5½ per cent.....147,900

Surplus.....12,501

In 1846 the total receipts were.....\$589,061

And the ordinary expenses.....\$309,641

Interest on funded debt.....108,530

Dividends, 5½ per cent.....140,725

Surplus.....30,185

#### Iron Trade.

We learn from the Mining Journal of October 23d, that rails were quoted at £8 10s. a £8 15s. average.

A correspondent of the Mining Journal says that, "This has been another dull week in metals, no sales of any consequence having been made. IRON—Welsh bars are a shade lower; a small parcel of Swedes has been sold at £11, ex-ship. COPPER is steady; some of the Chillian ingots have moved off at £90, but 900 tons are still on the market. TIN—English and foreign very dull of sale; the few orders on hand are withheld in expectation of lower prices. SPelter is a shade lower than last week; the dealers are sellers at £18, and about 90 tons in second hands were sold on Wednesday at £17 17s.

GLASGOW PIG-IRON TRADE, OCT. 20.—Our pig-iron market is exceedingly dull this week: there is so little disposition shown to buy, that holders have been obliged still further to reduce their prices. The price of mixed Nos. may to-day be quoted at 57s. 6d.—cash.

BIRMINGHAM, THURSDAY.—There is no change to report this week. Stocks are low; the trade is still unaffected by the crisis, and were it not for the high rate of discount, the great premium which cash demands, and the little extra credit which, in some instances, is taken, the pressure would not be felt. The state of things, the Times would induce its readers to believe, is owing solely to the demand for iron for railway purposes; but, in fact, the makers of iron, in this district, for railway purposes are comparatively few. The generality of the iron-works are principally engaged in making other sorts of iron, for which there is a good and legitimate demand, both at home and on the continent. It is, therefore, not entirely owing to the demand for railway purposes that the iron-works are flourishing, while others are decaying.—*Birmingham Advertiser.*

ROAD MAKING. OR A MANUAL OF THE PRINCIPLES AND PRACTICE OF ROAD MAKING; Comprising the Location, Construction and Improvement of Roads, —Common Macadam, Paved, Plank, and Railroads. By WM. GILLESPIE, A. M., C. E., Professor of Civil Engineering in Union College.

"The roads of a country are," as the author justly observes, "accurate and certain tests of the degree of its civilization," and it may well be remarked that the location of the early roads of most new countries, are as often the result of accident as of design.

The same class of engineers that located some of the most important streets in the city of New York, have continued their labors throughout the country, since the early history of that famous city; and we sometimes find, in our rambles in the interior, in the location of town roads, a verification of a not uncommon expression, that "the farthest way round is the nearest way home." It is true, as a neighborhood, or country, advances in population, wealth and intelligence, the roads are improved by new locations, by filling up hollows, cutting down hills, and by going round, instead of over, the hills. Yet there is, in the general management of our country roads, less of judgment, industry and integrity than in any other of the pursuits of life. It is by some considered a duty—but more look upon it as a burden—as just so much time thrown away and lost, while another—and not a small—class consider it a good frolic, as there is usually quite a collection of persons who are under little or no restraint, and thus it is that the "high way tax," paid in labor gives less return to those who pay it, than any other tax paid by the people.

The views of the author upon this subject are sound and practical, and should be read by the people throughout the entire length and breadth of the land—as they are so truthful that good results would surely follow—and that we may do our part in disseminating them, we publish the chapter, upon "THE MANAGEMENT OF TOWN ROADS," entire, and suggest to those editors with whom we exchange, and to others also, to give it an insertion, or, at least, to call attention to it. We also recommend this manual to the perusal of every tax-payer for road making, and to the young men of the country, as they will find useful information in relation to each department of road-making, which will surely be useful to them in after life. It is published by A. S. Barnes & Co., 51 John street, New York, in an octavo volume of 336 pages, with illustrations of the various subjects treated of—and may, probably be had of the principal booksellers throughout the country, at least, we presume, than half its value, though we are not informed as to the retail price.

## THE MANAGEMENT OF TOWN ROADS.

"The money levied is more than double of what is necessary for executing in the completest manner the work, which is often executed in a very slovenly manner, and sometimes not executed at all."—ADAM SMITH.

A wise and well regulated system of managing the repairs of roads, and of obtaining the greatest degree of improvement with the least amount of labor, is as important as their judicious construction. The "Road tax" system, of personal service and commutation, though nearly universal among us, is unsound in its principle, unjust in its operation, wasteful in its practice, and unsatisfactory in its results. Borrowed from the "statute-labor" of England, and the "Corvée" or "Prestation en nature" of France, like them it is a remnant of the times of feudal vassalage, when one of the tenures by which land was held, was the obligation to make the roads passable for the troops of the lord of the manor. The evil consequences of the system will be examined, when we have briefly explained its organization in the state of New York, where it has been rendered as perfect as its nature permits.\*

The directing power is vested in "Commissioners of Highways," who are chosen in each town at the annual town meeting, and have "the care and superintendence of the highways and bridges therein." Subordinate to them are "Overseers," of whom are chosen, at the annual town-meeting, as many as there are road districts in the town. The commissioners have the authority to direct the overseers as to the grade of the road, how it should be shaped and drained, and the like. They may also lay out new roads. The principal duties of the overseers are to summon the persons subject to perform labor on the roads, to see that they actually work, and to collect fines and commutation money. The commissioners are to estimate the cost of improvements necessary on the roads and bridges of the town, and the board of supervisors are to cause the amount to be levied, but within the limit, for any one year, of two hundred and fifty dollars. But, if a legal town meeting so vote, the supervisors may levy "a sum of money, in addition to the sum now allowed by law, not exceeding five hundred dollars in any one year."

"Every person owning or occupying land in the town in which he or she resides, and every male inhabitant above the age of twenty-one years, residing in the town where the assessment is made, shall be assessed to work on the public highways in such town." The lands of non-residents are also to be assessed. The whole number of days' work to be assessed shall be at least three times the number of taxable inhabitants in such town; and may be as many as the commissioners shall think proper.

Persons assessed to work on the highways, upon receiving twenty-four hours' notice from the overseers, must appear either in person, or by able-bodied substitutes; or pay a sum of one dollar for each day's neglect,

unless they shall have previously commuted at the rate of sixty-two and a half cents per day. A team, cart, wagon, or plough, with a pair of horses or oxen, and a man to manage them, satisfies an assessment of three days.

Such are the principal features of the present system. They are all defective in a greater or less degree.

In the first place, the condition of the roads, which is so important an element of the wealth and comfort of the whole community, should not be allowed to remain at the mercy of the indolence, or false economy, of the various small townships through which the roads pass. In one town, its public spirit, wealth, and pride, may induce it to make a good road; in the adjoining town, a shortsighted policy, looking only to private interest in its narrowest sense, may have led the inhabitants to work upon the roads barely enough to put them into such a condition as will allow a wagon to be slowly drawn over them.

In the next place, the "commissioners" who have the primitive direction of the improvements and repairs, should be liberally compensated for the time and attention which they give to the work. Gratuitous services are seldom efficient; at best they are temporary and local, and dependent on the whims, continued residence, and life of the party; and if the compensation be sufficient, the same evils exist though in a less degree. Skill, labor, and time cannot be obtained and secured without being adequately paid for.

The third defect in the system is the annual election of the commissioners and overseers. When men of suitable ability, knowledge, and experience have been once obtained, they should be permanently continued in office. On the present system of annual rotation, as soon as the overseer has learned something in his year's apprenticeship, his experience is lost, and another takes his place, and begins in his turn to take lessons in repairing roads at the expense of their condition. In other occupations, an apprenticeship of some years is thought necessary before a person is considered as qualified to practice with his own capital; while a road overseer, the moment that he is chosen, is thought fit to direct a work requiring much science, at the expense of the town's capital of time, labor, and money.

In the fourth place, the fundamental principle of the road-tax is a false one. Its temporary custom of requiring rents to be paid in kind, has long since been found to be less easy and equitable than money rents. Just as work paid for by the piece is preferable in every respect to compulsory labor by the day. Men are now taken from their peculiar occupations in which they are skillful, and transferred to one of which they know nothing. A good ploughman does not think himself necessarily competent to forge the coulter of his plough, or put together its woodwork. He knows that it is truer economy for him to pay a mechanic for his services. But the laws assume him to be a skillful road-maker—a more difficult art than

plough-making—and compel him to act as one; though his clumsiness in repairing his plough would injure only himself, while his road blunders are injurious to the whole community. Skill in any art is only to be acquired by practical and successful experience, aided by the instructions of those who already possess it. An artisan cannot be extemporized.

Fifthly, labor by the day is always less profitable than that done by the piece, in which each man's skill and industry receive proportionate rewards. Working on the roads is generally made a half holiday by those who assemble at the summons of the overseer. Few of the men or horses do half a day's work, the remainder of their time being lost in idleness, and perhaps half of even the actual working time being wasted by its misdirection.

Lastly, it follows from the preceding, that the commutation system operates very unfairly and severely upon those who commute; for they pay the price of a full day's work, and their tax is therefore doubled.

Such are the principal defects of the present system of managing the labor expended on town roads. But it is much easier to discover and to expose, than to remove them. In the following plan the writer has endeavored to combine the most valuable features of the various European systems, and to adapt them to our peculiar institutions.

In each state, a general legislative act should establish all the details of construction, and determine definitely "What a road ought to be," in accordance with the theory and practice of the best engineers. Surveys should be made of all the leading roads, and plans and profiles of them prepared, so that it might be at once seen in what way their lines could be most efficiently and cheaply improved.

The personal labor and commutation system should be entirely abolished. If the town-meeting would vote a tax in money of half the amount now levied in days' work, its expenditure under the supervision to be presently described, would produce a result superior to the present one. When the road is a great thoroughfare, extending far beyond the town, it would be unjust to levy upon it all the expense; and a county tax, or, in extreme cases, a state appropriation, should supply what might be necessary.

In regulating the expenditure of the money raised, the fundamental principle, dictated by the truest and most far-sighted economy, should be to sacrifice a portion of the resources of the road to ensure the good employment of the remainder. The justice of this principle needs no argument; its best mode of application is the only difficulty. The first step should be to place the repairs of the roads under the charge of a professional road maker of science and experience. On his skill will depend the condition of the roads, more than on local circumstances or expenditures. His qualifications should be tested by a competent board of examiners, if he should not have received special instructions in the requisite knowledge, such as might well form a peculiar department of education in our Colleges

\* A convenient edition of the revised road act, with commentaries, etc., was published at Rochester in 1815.

and Normal schools. As each town by itself could not afford to employ a competent person, a number of them (more or less according to their wealth and the importance of the roads within their bounds) should unite in an association for that purpose.

The engineer thus appointed should choose, in each township, an active, industrious man, of ordinary education, to act as his deputy in making the expenditures in that town, and as foreman of the laborers employed during the season of active labor on the roads. This deputy might be busily and profitably employed during the entire remainder of the year, in constantly passing over in due rotation the whole line of road under his care, and making, himself, the slight repairs which the continual wear and tear of the traffic would render necessary. If taken in time, he himself could perform them; but if left unattended to, as is usual, till the season of general repairs, the deterioration would increase in a geometrical ratio, and perhaps cause an accident to a traveller, which would subject the town to damages tenfold the cost of repairs.

The laborers hired by the deputy in each town should be employed by piece-work as far as is possible. This can be carried out to a great extent, when the superintendent is competent to measure accurately the various descriptions of work, and to estimate their comparative difficulty. When the work cannot be properly executed by portions allotted to one man, it may be taken by gangs of four or five, who should form their own associations, make a common bargain, and divide the pay. In work not susceptible of definite calculation as to quantity or quality, and in such only, day labor may be resorted to under a continual and vigilant superintendence.

In such a system as has been here sketched, the money-tax would be found to be not only more equitable than the personal-labor system, but even less burdensome. None of it would be wasted; and those who had skill and strength for road work would receive back, in wages, more than their share of it; those who were skilful in other work might remain at that which was most profitable to them, and pay only their simple share of the road-tax, not double, as when they now commute; and the only losers by the change would be the indolent, who were useless under the old system, but under this, would be obliged to contribute their share; while great gain in every way would ensue to the community at large. The subject urgently demands legislative attention.

#### The Vacuum Engine.

Having, in the *Mining Journal* of the 18th Sept., given a concise description of the system of pneumatic propulsion, as patented by Messrs. CUNNINGHAM and CARTER, and having heard considerable objections started to the vacuum engines, which form the basis of their plan, we now offer a few remarks thereon, hoping thereby to call the attention of others to their merits much better qualified than ourselves to appreciate and describe them. Our readers will remember that the pneumatic railway consists of a close tube

the entire length of the line, without any continuous valve, or opening, of any description, excepting at the side valves, in connection with the vacuum engines, placed at every 300 feet. The engine, itself, consists of merely a cylinder and piston, with double slide valves—the atmosphere thus alternately pressing on either side of the piston, when the communication with the exhaust tube is open, precisely similar to the action of steam in a high-pressure steam-engine. Now, in the high-pressure engine, the induction openings are so small, in proportion to the area of the piston, that the steam is actually wire-drawn, and then cut off at, perhaps, half the stroke, for the purpose of economising fuel, and taking advantage of the property of the expansibility of steam—and thus the power is admitted, but gradually, compared with what it would be, if the induction valves were (say) of four times the area. Now, in these vacuum engines, the element employed being inexhaustible, and supplied by nature without cost, the areas of the openings for the action of the atmosphere on the piston, when the connection with the exhaust tube is open, are made as large as consistently proportionate with the area of the piston itself. The consequence is, that, instead of the atmosphere creeping through a small opening, and acting only by degrees on a large surface, the whole pressure, according to the state of the vacuum, is admitted with a sudden impulse, and thus adds considerably to the calculated power obtained. One great, and we believe the principal, objection made to the system, has been, "that no piston rods and cranks, however strong in proportion to the size of the cylinder, can withstand the sudden shock of a removal from their *vis inertia*, or state of rest, to that of rapid motion, by a train going at a rate of 30, 40, or even 60 miles per hour." Now, this would be a very valid objection, were the wheels connected by cogs, or was the machinery in any degree of a complex nature; but, in this case, the rails of the carriages being wedged close between the revolving wheels, with plane peripheries, and these being on the crank shaft, and thus the whole bound firmly together; while on one hand, the instant the connection with the tube is open, the crank is certainly suddenly set in motion with great rapidity—on the other, the train itself acts almost in the capacity of a fly-wheel, and keeps the moving power itself properly regulated: in addition to which, it must be remembered, that there is no enormous weight, such as a train of 90 or 100 tons to set in motion; the only bodies to start from their *vis inertia*, being the three horizontal wheels and the piston, and these are gradually brought into action by the peculiar form and position of the guide rails. The model, at all events, works well, creates much interest, and gives great satisfaction to numerous scientific men, who witness its performance; yet it would be highly satisfactory to all parties, and at once solve the problem of its capabilities, if about a mile of a railway could be obtained, where the principle could be fully tried. Although

the nature of the vacuum engine is, of course, well known; we are satisfied, from its never having been brought into any general use, that its powers and capabilities, as applicable to railway purposes, in all their important bearings, and as a peculiarly powerful auxiliary for safe and certain operations at stations, have yet received but little investigation.

#### SULPHURIC ETHER,

*In connection with steam as a motive power.*

A patent has been recently enrolled by Mr. Newton, of Chancery lane, for the employment of the elastic vapor of sulphuric ether as a motive power, not absolutely instead of steam, but in connection with it; the caloric from the steam, after it has done its duty, being sufficient to vaporize the ether. The principles of action are, the passing of the steam, after it has exerted its force upon the piston of a steam engine of the usual construction, not into the condenser, as in condensing engines, or into the atmosphere, as in high pressure engines, but into a certain apparatus, which the inventor terms a 'generator,' or 'vaporizer.' The steam is, immediately upon its introduction into the generator, condensed, by contact with the surface of the apparatus, while the heat absorbed from the steam, during condensation converts into vapor the sulphuric ether, or other highly volatile fluid, which may be used under this patent; the quantity, and, consequently, the power obtained, being in proportion to the amount of caloric in the steam. This vapor is then employed in the propulsion of a piston within a cylinder, similar to a common steam engine, and acting in unison with the steam cylinder—the piston being connected by the usual method of piston rod, connecting rod, and crank to the same shaft to which the steam piston is attached. The elastic vapor, after having exerted its force upon the piston, is conveyed away by proper pipes to a vapor condenser, where it is condensed into fluid by simple contact with cooled metallic surfaces, which are constantly kept at a temperature sufficiently low to effect the condensation of the vapor, immediately on its coming in contact with them. The condenser is kept cool by a stream of cold water, or a current of cold air. The condensed fluid, undischarged vapor, and what atmospheric air may have entered, is withdrawn out by air pumps, in the usual manner, and deposited in a receiver, provided with a means of expelling and discharging all vapors which may have accumulated, and the lower part of which is connected with the vaporizer, by which it may be supplied with sulphuric ether, or other volatile fluid. The water produced in the vaporizer, from the condensation of the steam, is drawn off by a pump, and discharged into the steam boiler. The mode of making the stuffing boxes air tight for the etheric vapor is by means of water pressure exerting its force through the medium of leather, and acting in opposition to the pressure of the vapor and preventing its escape. The invention can be applied to any description of engine—stationary, marine or locomotive. —*London Mining Journal.*

**Gauge, or Width of Track for Railroads.**  
*Report on the Gauge for the St. Lawrence & Atlantic Railroad.* By A. C. Morton, Esq., Chief Engineer.

Continued from page 761.

This would not be the result were the engines on that road more powerful. Trains propelled by two or more engines are of necessity delayed at all the wood and water stations, or where cars are to be taken and left on side tracks.

Attaching a number of engines to one train operated most unfavorably, from the unequal manner in which the separate engines act, and the increased liability to accident. It also adds very materially to the cost of transportation.

Mr. J. McConnell, superintendent of the locomotive department of the Birmingham and Gloucester railway, a narrow gauge advocate, states in his testimony before the gauge commissioners that, "We find from experience that economy of working is very much assisted by taking the trains by one heavy engine, instead of two light ones, that is to say, you save the wages of two men, and I think the expense of repairs is very much reduced, and materials, for instance, oil, tallow, etc., and the consumption of coke in the one engine is not at all equal to the consumption of the two, which only do the same amount of work."

Mr. Wm. Cubitt, a distinguished civil engineer, states in his testimony before the same commissioners, that "Large and powerful engines are more cheaply worked in proportion than smaller ones for the work they do," and adds, in relation to the consumption of coke, etc., "that they are cheaper altogether. With regard to manual attention, and all that, it takes the same expense to work a small engine as it does a large one, and they can be more economical in coke, with reference to the work they can do. The same quantity of repairs will cover more work."

The first cost of large engines is cheaper in proportion to their power than small ones.

The history of every species of transportation affords evidence of the advantage and economy of carrying large loads. Canals and railroads were introduced on account of the facilities they afforded for moving large loads, thereby lessening the cost of transportation.

The enlargement of the canals of New York, Pennsylvania and Canada, was made for the purpose of increasing the tonnage of vessels, as a means of lessening the cost of transportation.

By enlarging the Erie canal from its original dimensions to 7 feet deep and 70 feet wide, it was estimated that the cost of transportation would be reduced 50 per cent.

It is ascertained from experience that increasing the tonnage of boats on the Delaware and Hudson canal from 31 to 45 tons, reduced the cost of transportation 33 per cent., and the saving this made on the business of the canal for two years reimbursed the cost of its enlargement. By the application of steam to vessels for navigating lakes and rivers and also large canals, a larger class of

vessels have been introduced, carrying greatly increased loads, and the effect has been a great reduction in the cost of transportation.

These various modes of transportation alluded to, show the efforts that are making to provide more efficient means for the vastly increasing business of the country, and the advantages which will accrue from increased facilities and ability to move larger loads. If we refer to the history of railroads, it will be observed that from the time at which they were in the most rude state up to the present day, there has been a constant effort to gain an increase of power.

It was not till 1829 that any very great improvement of the locomotive engine was accomplished; and from the opening of the Liverpool and Manchester railroad in 1830 we may date the introduction of locomotive engines generally on railways in preference to any other power. From that day to the present there have been constant changes and improvements going on in the character of engines and the railways upon which they were to operate.

I need scarcely allude to the vast improvements which have been made within a comparatively short space of time, for every person is familiar with the subject.

When it is recollected, however, that in 1829 it was considered a great feat for a locomotive to draw 12 to 15 tons 70 miles at the rate of 14 miles per hour, it certainly must excite feelings of the utmost admiration that in 1846 a locomotive engine on the broad gauge was able to draw over 100 tons, a distance of 116 miles at an average velocity of 49 miles per hour, running 10 miles of this distance at the rate of 66 miles per hour, and two miles at a speed of over 69 miles per hour.

These are results that have been obtained in England by the adoption of the broad gauge, which has been in use comparatively but a short time. The narrow gauge having been adopted on the first introduction of railways, improvements have from time to time been made in the engines of this width till finally, as the commissioners state, no further addition to their power can well be made, yet their best performances fall far short of the results above stated. What results may we not expect when the same efforts shall have been made to develop the power of the broad gauge engines?

Large and powerful engines have been objected to on account of the injury which they cause to the road. With heavy engines it is of course necessary to construct a more perfect road and to either increase the weight of the rail or the number of bearing points of the engine. The plan of track adopted for your road contemplates the use of the heaviest class of engines. The rail is of an approved pattern both for strength and durability, and with the continuous support given by the sills it is equal to a rail of 80 or 90 lbs per yard on cross sleepers as they are usually laid.

It is urged as an objection to the broad gauge that the resistance is greatly increased in passing round curves in consequence of

the greater length of the outer rail and the slipping of the wheels in passing over this increased distance.

No difficulty has been experienced in passing around curves of small radius at great velocity even with a gauge of 7 feet, and with a gauge of 5½ feet the width bears so small a proportion to the radius of the curve that there would be no difficulty in this respect, and but a small increase of slipping would result from the excess of width over the narrow gauge were there no provisions to lessen its effects.

Improvements have been made both on locomotive engines and cars which lessen the resistance on curves, and this undoubtedly will be still further reduced by improvements which are constantly making in railroad machinery.

As cars were formerly constructed, the axles being placed at a greater distance from each other, the friction was greater. In the United States, four wheeled cars have mostly gone out of use, and those having two pairs of wheels at each end of the car have been adopted, the axles of which are placed nearer together, which obviates in a great degree this difficulty.

On your road, as well as other great lines in Canada, the character of the country is such as to require comparatively but a small amount of curvature, and this increased width of track will not be attended by any material loss of power or inconvenience in this respect.

The increased cost of construction is another objection urged against a wider gauge to which much importance has been attached.

But on examination, this will be found of comparatively little importance, particularly with the gauge adopted for your road. The width of roadbed is not necessarily increased, although in the consideration of this subject it would be well to provide as much additional width as is given to the tracks.

Most of the narrow gauge roads in the United States are graded in the first instance for a single track, and the width of road bed on embankments varies, being on different roads from 12 to 15 feet. For double tracks it is generally from 24 to 26 feet.

Your road is being graded for a single track having a surface width of 15 feet with provision for a double track which is 26 feet.

The New York and Erie railroad which has a gauge of 6 feet is graded for a single track with a width of road bed on embankments of 15 feet, while many of the narrow gauge roads have the same width, and no inconvenience is experienced for want of more space in either case.

The London and Birmingham road in England and several narrow gauge roads in the United States have a width on embankments of 26 feet, and this is the width proposed for your road. It therefore appears that on many important roads of that gauge as great a difference exists in the width of road bed as would be the increase necessary for a gauge of 5½ feet.

The width from centre to centre of tracks will be determined by the width of cars from

out to out, and the space between cars when passing each other.

On most roads the space between tracks is 6 feet, and the width of cars has been increased to 9 feet 6 inches, and in some instances to 9 feet 8 inches.

The clear space between cars should not be less than 18 inches, and assuming the width of cars to be 9 feet 6 inches, the distance from centre to centre of tracks will be 11 feet.

Now, if we allow the space for both gauges to be 11 feet, add the width of track, and it gives for the narrow gauge 15 feet 8½ inches and for the 5½ feet track 16 feet 6 inches between outside rails, making a difference due to the latter gauge of 9½ inches.

But allowing 18 inches between cars, with the widest car that would ever be likely to be adopted on 5½ ft. gauge, the increased width of road bed would be only 2 feet. This extra width if strictly applied to all parts of the road would require an increase of 2 feet in the length of culverts, bridge, abutments, etc. This addition is of course to the body of those structures only, the wings, parapet walls, etc., remaining the same in either case.

These additions, were they really made, would on your road amount to but a trifling sum, as there are scarcely any deep rock cuttings, heavy excavations or embankments, and no tunnels. The mechanical structures are generally of a cheap character.

But it is not proposed to add to the dimensions; for the width which is adopted on narrow gauge roads has been found to answer every purpose for an increased width of track. The space left outside of the rails for your road, as now graded, will be nearly 5 feet; and this is deemed sufficient.

The bridges have, when the roadway is on the lower chords, a clear space between the trusses of 15 feet, yet on several narrow gauge roads the space is no less, while some have more than this.

Bridges designed for the road way on the top chords, (of which character are nearly all your more important structures) are not necessarily enlarged, for the trusses may be placed in such a position as will conduce both to economy and strength.

The trusses of this description of bridge in course of construction for your road are placed 12 feet apart for a single track, which, with the thickness of the trusses, gives a top width of from 16 to 18 feet, and when the third truss is added for a double track, it is placed at a distance of 9 feet, the masonry being designed for this in the first instance.

This effects a great saving, and the dimensions need not differ from the same kind of bridge designed for a narrow gauge road. Adopting the same kind of track which is proposed for your road, the difference in cost would be a mere trifle, or with a cross sleep or road, the increased cost would not exceed £8 per mile.

As it regards the cost of cars, I am able to state from the communications of builders on the subject, that the increased cost will be comparatively small, and will consist mainly

in the extra weight of the axles due to the greater width of track.

It is probable that with a 5 1-2 feet track, inside bearings for cars will be considered preferable, in which case the axles will be about three inches shorter than those at present in general use on the narrow gauge. Car builders state that the cost of cars of this description will be no more for the wide track than for the narrow. It is stated on roads where both inside and outside bearings have been extensively used, that the former are preferred, and that for cars to be constructed hereafter, no other will be used—that, with inside bearings, the cars are easier on the journals and the road, and are in every respect safer, that the journals are less liable to break, the cars move easier around curves and in case of breaking a wheel or axle, the effect is less disastrous to the train and the road. They are objected to on account of the greater trouble of oiling, and liability to get more dirt in them. The former is a comparatively small objection, and the latter, if it exists at all, may doubtlessly be removed.

The amount paid for the last passenger cars ordered for the Erie road, (having a gauge of 6 feet,) which seat 69 passengers, independent of the saloon, was no greater than the amount charged for cars of the same finish, seating the same number of passengers for the narrow gauge roads of the eastern States.

The cost of engines will be no more in proportion to their effective power for a wide gauge than for a narrow; and I was informed a short time since by a large manufacturer that he would make no difference in the cost between engines on the ordinary gauge, and those of 5 1-2 feet track.

The reasons assigned, are the greater conveniences and facilities for arranging economically the working parts for inside connections.

Allowing that the items of increased expense above referred to are incurred on your road, (which as before remarked will not be the case) the aggregate will not amount to 1½ per cent. on the total cost of the road.

It has been suggested that greater difficulties would be encountered in removing the snow on a wide track than on a narrow. The increased resistance from this cause, resulting from the difference between the narrow track and the gauge adopted for your road, will, I believe, be found very small and hardly worthy of notice.

It certainly will prove of little consequence compared with the increased power which this greater width gives to the engine. It is a strong argument in favor of a wide gauge that the engines may be constructed of greatly increased power, with a view to overcome more readily this difficulty.

As an evidence that the effect of widening the gauge, and increasing the power of the engine, is to lessen the difficulties of removing the snow, I would refer to the great storm of 1845, which obstructed nearly all the roads in the northern part of the United States.

The Erie road, with a gauge of 6 feet, lost but one trip, while the main lines (narrow

gauge) south of New York, were impassable for a number of days.

You are aware, however, from the favorable character of the country, a very large portion of your road will be on embankments elevated five or six feet above the general surface of the ground, which will much facilitate the removal of snow, allowing the winds to sweep more freely over its surface, and thus prevent any great accumulation on the track.

The most prominent objection which can be made to a wide track is, the connection with other roads of a different gauge, and the necessity of transferring freight and passengers from one line to another.

This, under certain circumstances, would evidently be so serious an objection as to overcome all considerations in its favor, and again, under other circumstances, it may be less objectionable than other difficulties.

As it regards the connection of your road with other lines, I know of only one which is now contemplated that would have any bearing on the subject of gauge.

As there are but 15 miles of road in operation in Canada, and only 8 more for which definite arrangements are made for the narrow gauge, the question of connection is not therefore necessarily involved in any difficulty here. From the position of Montreal, the great mass of freight would necessarily be transhipped here.

This at present is unavoidable. In the event of the construction of a bridge across the St. Lawrence, which is a work entirely practicable, and of great merit: and also the construction of a line of roads extending to the upper province, there would still be a transfer of a very large quantity of freight at Montreal, particularly during the season of navigation.

Should a bridge be constructed across the St. Lawrence river, there is no practical difficulty in carrying your road and the St. Johns road over on the same bridge on account of a difference of gauge, and further than this, there is no necessity for a connection.

And until other roads shall have been constructed above the Lachine road, there will be no reason for a connection with this line. The question of gauge, therefore, as far as concerns a connection with any other road in Canada yet constructed, is an open one, and is not embarrassed by existing lines.

There is a branch, however, contemplated by which it is proposed to connect your road with the Passumpsic and Connecticut River railroad, in the State of Vermont, which is intended to form part of a line to Boston.

This may be considered an important branch to your road—the peculiar features of which, and the nature of the business to be expected from it, we will proceed to consider.

The distance from Montreal to Boston, via the most direct lines now in connection with the Passumpsic road, is about 367 miles, and in this distance there are six different corporations. These roads will differ in length from 14 to 128 miles, and each of these, so far as completed, is operated by the company to whom it belongs.

The chief objection to this route for through

traffic as compared with the Portland line, consists in its greater distance to the seaboard and the greater number of separate roads of which the line is composed.

When several roads are operated in connection, forming in the aggregate a line of several hundred miles in length, with lateral lines extending in various directions, it is found extremely difficult so to regulate the distribution of cars as to meet the demands of trade.

Serious difficulties have been encountered in the United States, where many long lines are composed of distinct roads of various lengths, operated by separate corporations.

Each corporation has its local trade which it is highly important should be accommodated; to do this cars must be provided for each station on the main line and its branches;—and at the same time others returning to the several branches of other roads, composing the line, and to lateral roads, which constitute parts of other main lines.

It will be readily perceived that without the most perfect arrangement there will be difficulties in returning the required number of cars to all the stations at the time they may be wanted.

Cars often find their way on to other lines which have no arrangement for an interchange and are missing for months.

There are periods of the year when there is a vastly increased amount of business to be done not only of local but of through traffic, and in many instances the trade preponderating greatly in one direction, the cars are many of them to be returned empty.

Trade varies on different roads, and is subject to changes more or less at various stations on the same line, and it often becomes difficult even for one corporation to systematize its business so as to return cars to the proper stations to meet the immediate demands of its own trade.

But when we combine a large number of corporations having an aggregate length of road of three or four hundred miles, each corporation operating its own road, and each striving to accommodate its own local business, there will unavoidably be much confusion and irregularity.

The agents at the various stations are always desirous of securing the requisite number of cars to dispose of freight that may have been left in their charge, with the urgent solicitation of the owners that it should be forwarded immediately.

And often various descriptions of freight must reach market within a limited time, or the owner and the company with whom it is deposited suffer serious loss.

Under these circumstances, it is not surprising that every station agent should use every effort to secure a sufficient number of return cars in which to forward the freight left in his charge.

Commencing at the end of the line towards which is the greatest tonnage, the cars on their return are many of them empty or lightly loaded, and these are to be left at various stations, the number to be regulated by the

amount and the pressing nature of the business to be done.

The consequence is, that in the anxiety to accommodate all the business, the greater number of cars are left at way stations and branches nearest the terminus or market, while the more remote stations in the interior and the other extremity of the line are unsupplied.

These difficulties are much enhanced by an increased number of roads forming the line, particularly when each road is under distinct management.

There is now in operation an uninterrupted line of railway between Boston and Buffalo. The distance is 535 miles, and there are 10 distinct corporations, each of which operates its own road.

The difficulty of effecting satisfactory arrangements with the several corporations, and the impossibility of controlling the return and proper distribution of cars to the several roads, render necessary a transshipment of freight at Troy.

But even with this division of the line it is found extremely difficult to return the cars westward so as to meet the demands of trade.

A portion of the time during the great press of business last winter, it often occurred that there were no freight cars, or a very limited number, west of Syracuse, about midway of the line between Troy and Buffalo, nearly the whole being detained on the eastern portion of the line.

This result arose in a great degree probably from imperfect arrangements and the want of a full supply of cars; but it shows conclusively that on a long line of roads operated by separate companies, much difficulty will be experienced in the return of cars.

To be Continued.

#### NEW IRON BRIDGE.

Circumstances having of late, says the Manchester Examiner, directed a great deal of public attention to railway and other bridges, of iron structure, particularly the former, and shown that some of those formerly believed to have been made on a principle which ensured their safety, are really not so, it is important to know that further attempts are being made to construct bridges, which shall, to a much greater extent, combine safety with economy and simplicity. Yesterday we saw a model of one which is said to combine these important properties, and is now exhibiting at the Town-hall warehouse, Cross-street. It is a perfect arch, composed wholly of iron, is 22½ feet long, 8 inches deep, 20 broad, and weighs about 6½ cwt. It combines the arch with the abutment bridge, and they can be used separately or together. All the tension parts are made of wrought-iron, and the compression parts of cast-iron. It is so constructed that the rafter and ring-post principle intersect throughout the whole of the structure; and there are chains at the bottom and centre for keeping the whole in a perfect state of tension, thus equally distributing the weight or pressure. The model now supports a weight of 50½ cwt. without having the abutments up; it, consequently depends upon the chains entirely.

We are told that, if the weight be taken off the centre of the arch, its curve would still be maintained without the slightest deviation: it possesses another important property—that of compensating itself against heat and cold.

#### RAILROAD SPEED INDICATOR.

An ingenious contrivance for registering the speed on railway trains, has, within the past week, been deposited in the Royal Polytechnic Institution. The apparatus is intended to prove the rate of travelling by railways, and also the time occupied by each stoppage at the various stations on the line. As a description of this invention might be acceptable to our readers, we give the following account:—The paper which is to receive the register, is a long slip, about one inch broad, and length proportioned to the time the train may be upon the journey. This paper is rolled upon a small cylinder in the first instance, and one end is made fast to a cylinder of larger size, about 8 or 9 in. in diameter; this cylinder is then made to revolve by means of a clock, attached to the apparatus—so that it turns round every half hour; consequently, about three-quarters of an inch of the paper passes any given point every minute; a pencil is now fixed to the upper part of the apparatus, so that it presses on the paper—consequently, as the paper moves round, would make a straight line upon it, were it not that the pencil itself had a lateral motion given to it. This arrangement is so attached to the train, that the pencil moves from one side of the paper to the other every quarter of a mile that the train travels. By this compound motion, a series of diagonal lines are produced upon the paper; the number of lines indicate time. As soon as the train arrives at a station, a straight line merely is produced; and, by observing the length of this line, it indicates how long the train was at the station. The apparatus is the invention of a gentleman named Ricardo.

#### Items.

**Patent Forge and Fan Blast.**—Lieut. Col. Dundas, C. B., director of the foundry department; Lieut. Col. Gordon, director of the carriage department; Lieut. Col. Colquhoun, of the same department; and Major Palliser, of the proof department, assembled at Woolwich dockyard, recently to witness experiments with Mr. Haig's patent forge and fan blast, for producing great heat with manual labor only. The first experiment was made to ascertain its capabilities compared with the common smith's bellows and forge attached to the troops of royal horse artillery and field batteries, when employed in active service; and it was shown that Mr. Haig's plan was not only efficient for all that the bellows and smith's forge could accomplish, but its far greater advantages were shown by a broken axle of a field carriage being brought to an excellent welding heat, and welded in 25 minutes. A similar result could not have been effected with the usual smith's forge.—The next experiment was made in the dial square of the foundry department, two of Mr. Haig's machines being placed adjoining a furnace for fusing iron or cast metal—one

of the machines being worked by a lever handle, and the other by a crank handle.—An excellent casting was soon obtained, and the crank handled machine shown to be the best and easiest worked. An experiment also took place to ascertain the efficiency of the fan-blast in making shot red hot, and in eight minutes 12-pounders were made red hot, and ready for firing. The invention is very portable, and suitable for ships and war steamers and will be a great advantage in the field, and at foreign stations, where small parties of artillerymen are attached.—*London Mining Journal.*

**Electric Magnetic Telegraph in Austria.**—The works for the construction of the electric magnetic telegraph along the principal line, at Gratz, are almost completed; and as this telegraphic line will also go over the Sommering Pass, where as yet there is no railway road, it will join the Austrian telegraphic station at Gloggnitz—by which means there will be an uninterrupted rapid communication between Gratz, Vienna and Cilly, which in the present state of Italian affairs is of the greatest importance. Some of the peasantry, who came too near the wire, for curiosity, to examine it, received such a severe shock that they fell to the ground. This occasioned such a superstitious fear throughout the whole valley of the Murthul, that all the inhabitants are afraid to come near this wonderful machine; and it is therefore unnecessary to keep a watch upon the works to prevent people from coming too near.—*Ibid.*

**Copper Mines of Cuba.**—We learn from Madrid, that a company is in course of formation there, with the object of working some copper mines in Cuba. It demands that it should have, during a period of forty years, the privilege of importing into Spain copper ore free of duty, and then, again, the same privilege of exporting abroad. It also demands that a duty should be imposed on all other companies exporting from Cuba. This matter had been referred by the government to the royal council, by whom it was decided with a majority of eight votes to seven, that the privilege of free importation from Cuba should be granted, but for 25 years only.—*Senor Burgos*, an influential member of the council, has a so considerable interest in the company.—*Ib.*

**Improvements in Copper Smelting.**—We understand a patent has been obtained for a process of smelting copper ores, whether consisting of the oxides, sulphurets or carbonates on a principle entirely new, and by which pure merchantable copper can be produced at a cost of £5 per ton. We have every reason to believe that we shall be enabled, in our next number, to lay before our readers a part, if not the whole, of the specification, with diagrams, explanatory of the buildings and machinery required in the manipulation. The trials of new methods now in operation at Swansea, Dartmoor, etc., and the success which appears to have followed Mr. Bankart's experiments, render the present invention of great interest to every one at all connected with the copper trade; and we shall endeavor

to give the fullest, and most clear, account of the process, that the materials with which we may be furnished will enable us to do.

**Institution of Mechanical Engineers.**—The next general meeting of the members of the Institution of Mechanical Engineers, is to be held in the Institution-rooms, Temple-buildings, New street, Birmingham, on Wednesday next, the 23th inst., when the President, G. STEPHENSON, Esq., will take the chair.—Papers will be read on the following subjects:—On a safety break for railway carriages—on the practicability of effecting a mechanical communication between the guards and engine drivers of railway trains—on Smith's patent steam indicator, for marine and other boilers—on the fan blast (supplemental paper)—on iron suspension bridges—on a turn-table lathe—on the balancing of railway wheels—on a steam helve—on boring cylinders—on locomotive engines for luggage trains—on a machine for perforating plates for tubular bridges, boilers, etc.—on the application of Jones's patent gas exhaust, as a substitute for the fan blast. We shall give a report of the proceedings in our next Journal.—*Ib.*

**Improvements in the Screw Winch.**—We have seen a new description of this useful tool, which has just been registered by Messrs. Smith and English, of Princes-street, Leicester-square, which, while it possesses all the powers and capabilities of the old screw-handle screw winch, can be applied in a considerably less time, is equally effective, and much more economical. The fixed jaw and handle is the same as usual, only the latter has a serrated rack on its upper surface. The moveable jaw has a corresponding rack in the upper face of the slot, and is furnished at the bottom with a pin, which makes a quarter revolution—having on one portion of its circumference a flat surface, and worked by a trigger. When this flat surface is uppermost, the jaw slides easily; but, on depressing the trigger, the cylindrical face of the pin bites against the handle, and fixes the jaw by the aid of the two racks. It works with the greatest rapidity.—*Ib.*

**Telegraphic Communication with France.**—We understand that arrangements are in progress for carrying a line of submarine telegraph from Dover to Calais—indeed we are led to expect that, in a few weeks, all the advantages of instant intercommunication between the two countries will be in full operation.

**Parsey's Compressed Air Engine.**—We understand that an air chamber, on Mr. Parsey's principle, constructed at Birmingham, is now in London, and will be very shortly tested. It is represented to us as an exceedingly strong piece of machinery; and we shall be anxious to learn the results of the trial.

#### A WORD TO THE FEW. ¶

The current volume of the Journal is nearly completed—four numbers more, and the Index, will complete the twentieth volume, and the fifteenth year of its publication. There are yet quite a number of accounts for the current year—as well as a few for previous years—which are not paid. This delay to

each subscriber cannot benefit the parties—while to us the delay of one or two hundred is a very serious matter, and may even be the cause of discontinuing the publication entirely.

The difficulty, and expense, of sending an agent to each subscriber—scattered, as they are, all over the Union—is to great to be encountered; and the losses from removal, changes of circumstances and death—when the accounts are suffered to run for several years—are to great for so small a circulation: therefore it has become a matter of necessity to call upon those in arrears to remit the amount by mail at once—before the close of this volume, if possible; and I will add that it will save trouble and postage, and be only a fair return for past delays, to enclose, at the same time, the next year's subscription. By doing so, they will materially promote our convenience, and the prosperity of the Journal.

I shall hereafter, while the Journal is under my charge, give to it my undivided attention, and hope to be able to make it deserving of a prompt and liberal support, and I shall look to every friend of the cause for aid in sustaining it.

#### THE NEWCASTLE MANUFACTURING

Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. ANDREW C. GRAY,

a45

President of the Newcastle Manuf. Co.

#### RAILROAD IRON AND LOCOMOTIVE

Tyres imported to order and constantly on hand

A. & G. RALSTON

by Mar. 20th

4 South Front St., Philadelphia.

**NOTICE TO CONTRACTORS.—GREAT WESTERN RAILWAY, CANADA WEST.**  
Sealed proposals will be received until the 1st day of next October, at the Office of the Great Western Railway Company, for the Grading and Masonry of the Western Division, extending from London to Windsor, a distance of one hundred and ten miles; also for the branch to Port Sarnia, forty-five miles in length.

Plans and Specifications of the work can be examined at the Engineers' Office, in Hamilton and London, on and after the 15th of September.

C. B. STUART, Engineer.

Hamilton, July 30, 1847.

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 48 in calibre and 2 to 12 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T. L. and other fixtures to suit, fitting together with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to  
**FULLER & BROWN, Agents.**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

**CHILLED RAILROAD WHEELS.—THE**  
undersigned are now prepared to manufacture their Improved Corrugated Car Wheels, or Wheels with any form of Spokes or Disks, by a new process which prevents all strain on the metal, such as is produced in all other chilled wheels, by the manner of casting and cooling. By this new method of manufacture, the hubs of all kinds of wheels may be made whole—that is, without dividing them into sections—thus rendering the expense of banding unnecessary; and the wheels subjected to this process will be much stronger than those of the same size and weight, when made in the ordinary way.

A. WHITNEY & SON,

Willow St. below 13th,

Nov. 10, 1847. [M.] Philadelphia, Penna.

**DAY, CROSKY & ROSS,**  
COMMISSION MERCHANTS,  
57 THREADNEEDLE STREET, LONDON.  
13 ORCHARD PLACE, SOUTHAMPTON.  
SHIPPING & COMMISSION AGENTS

FOR

**PASSENGERS, SPECIE, GOODS, PARCELS, &c.**  
To all parts of the United States, North and South America, West Indies, India, (overland or otherwise,) Constantinople, Egypt, the Mediterranean, the Peninsula, and all parts of France—via Havre.

Agents at Cowes for the Ocean Steam Navigation of New York.

Persons wishing to transact business with Messrs. D. C. & R., will please apply to the subscriber, who will make cash advances on consignments to their address.

July 31—3m

ROBERT GRACIE.

**LOCOMOTIVE AND CAR AXLES.**  
The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address  
**SAML KIMBER & CO.,**  
Willow Street Wharf,

Philadelphia, Pa.

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

HENRY BURDEN, Agent.

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**  
Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers, &c., by  
**JOHN A. ROEBLING, Civil Engineer,**  
Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Ships, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

92v11y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrestor recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburgh and Jackson Railroad, Vicksburgh, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckley & Drury, Boston, will be promptly executed.

**FRENCH & BAIRD.**  
N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

Philadelphia, Pa., April 6, 1844.

••• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed.

JOHN F. WINSLOW, Agent.

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merritt, New York; J. H. Whitney, do.; E. J. Ewing, Philadelphia; Wm. E. Coffin & Co., Boston.

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Patterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trallis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trallis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trallis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

### ESTIMATE OF THE PROBABLE COST OF ONE MILE.

1,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of

the Rail = \$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

No. 277 South Tenth St., Philadelphia. 331f

## LAP-WELDED WROUGHT IRON TUBES

FOR

### TUBULAR BOILERS,

FROM 1 1-4 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

THOMAS PROSSER,

Patentee.

1725

28 Platt street, New York.

## RAILROAD IRON.

### MOUNT SAVAGE IRON WORKS

THIS Company are prepared to execute orders for RAILROAD IRON, of any pattern, and equal in point of quality to any other manufactured.

Address J. M. HOWE,

Pres't. Mt. Savage Iron Works,  
Dec. 25, 17\* Maryland.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1710 near Third,

below Walnut,  
Philadelphia.

THE SUBSCRIBER has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

West Troy, May 12, 1847.

ANDREW MENEELY.

17\*21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniata Bloom suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,

121f Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to

MURDOCK, LEAVITT & CO.,  
Agents.

1748

77 Pine St., New York.

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE,

143 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 331f

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed.]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed.] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed.]

T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed.]

JOHN LEACH,

Jamaica November 12, 1845.

1y19

Sup't Motive Power

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

For sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,

75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.			CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.		Weight per fathom.	Diameter of iron.	
	INCH.	LBS. OZ.	INCH.	LBS. OZ.		LBS.	INCH.	Tons.
11	4	13 5	10	21 -		50	15-16	20
13	3	9 3	8	16 -		27	11-16	13
14	3	6 11	7	12 8		17	9-16	10
15	2	5 2	6	9 4		13	1-2	7
16	2	4 3	6	8 8		10	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

1y25

Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

1y25

G. A. NICOLLS,

Reading, Pa.

## THE SUBSCRIBERS, AGENTS FOR

the sale of  
Codorus,  
Glendon,  
Spring Mill and  
Valley,  
Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846.

[1y4]

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside. THOMAS & EDMUND GEORGE,

245 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Patent Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 3 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

# NORRIS' LOCOMOTIVE WORKS.

BUSHHILL, SCHUYLKILL SIXTH-ST., PHILADELPHIA,

**MANUFACTURE** to order Locomotive Steam Engines of every plan or size. Their shops being enlarged, and their arrangements considerably extended to facilitate the speedy execution of work in this branch, they can offer to Railway Companies unusual advantages for prompt delivery of Machinery of superior workmanship and finish. Connected with the Locomotive business, they are also prepared to furnish, at short notice, Chilled Wheels for Cars of superior quality. Iron and Brass castings, Axles, etc., fitted up complete with Trucks or otherwise.

**LAP-WELDED WROUGHT IRON TUBES** for Tubular Boilers, from 1½ to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patience.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 281

**SPRING STEEL FOR LOCOMOTIVES,** Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 1½ to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,

Albany Iron and Nail Works,

**THE SUBSCRIBERS ARE PREPARED TO** execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,

Philadelphia.

ROBERT NICHOLS, Agent,

No. 79 Water St., New York.

**PATENT INDESTRUCTIBLE WATER** Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits. This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly exposed on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

281

J. BALL & CO.

**CONNECTION BETWEEN THE BOSTON** and Lowell and the Boston and Maine Railroads. On and after April

1st, 1847, passenger trains will run as follows, viz:

Leaving Lowell at 7 11-4 a.m., and 2 1-2, 4 1-2, and 6 1-2 p.m., to connect at the junction in Wilmington with the eastward trains—at 7 a.m. and 2 1-2 p.m. with those to Portland; at 4 1-2 p.m. to Great Falls only, with a detention of 45 minutes at the junction, and at 11 1-4 a.m. and 6 1-2 p.m., to Haverhill only. Leaving the junction in Wilmington, for Lowell, at about 7 1-4 a.m. on arrival of the morning train from Haverhill; at about 9 a.m., on arrival of the morning trains from Great Falls. At about 11 3-4 a.m., on arrival of the morning train from Portland. At about 5 p.m. on arrival of the afternoon trains from Haverhill. At about 7 1-4 p.m. on arrival of the afternoon train from Portland.

WALDO BIGGINSON, Agent

## PATERSON RAILROAD

Commencing April 20th, 1847, the cars will leave

Paterson at	New York at
8 o'clock a.m.	9½ o'clock a.m.
11½ o'clock a.m.	12 1-4 o'clock p.m.
4 o'clock p.m.	5½ o'clock p.m.

On Sunday.

8 o'clock a.m.	9½ o'clock a.m.
4 o'clock p.m.	5½ o'clock p.m.

Office 75 Courtland St.

251

**BALTIMORE AND OHIO RAILROAD.**  
**MAIN STEM.** The Train carrying the

Great Western Mail leaves Baltimore every morning at 7½ and Cumberland at 8 o'clock, passing Ellicott's Mills, Frederick, Harpers Ferry, Martinsburg and Hancock, connecting daily each way with the Washington Trains at the Relay House seven miles from Baltimore, with the Winchester Trains at Harpers Ferry—with the various railroad and steamboat lines between Baltimore and Philadelphia and with the lines of Post Coaches between Cumberland and Wheeling and the fine Steamboats on the Monongahela Slack Water between Brownsville and Pittsburgh. Time of arrival at both Cumberland and Baltimore 5½ P. M. Fare between those points \$7, and 4 cents per mile for less distances. Fare through to Wheeling \$11 and time about 36 hours, to Pittsburgh \$10, and time about 32 hours. Through tickets from Philadelphia to Wheeling \$13, to Pittsburgh \$12. Extra train daily except Sundays from Baltimore to Frederick at 4 P. M., and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. s13yl

**LITTLE MIAMI RAILROAD COMPANY.**

Fall and Winter Arrangement, 1847. On and after Monday, September 20th, until further notice, a Passenger train will run as follows:

Leave Cincinnati daily at 9 A. M., for Milford, Foster's Crossing, Deerfield, Morrow, Fort Ancient, Freeport, Waynesville, Spring Valley, Xenia, Yellow Springs, and Springfield. Returning, will leave Springfield at 4½ a.m. Upward train arrives at Springfield at 2½ p.m. Downward train arrives at Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore & Co. are running the following stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheeling, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanesville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine & the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, is 32 hours. Distance from Cincinnati to Springfield by railroad.....84 miles.

From Springfield to Bellefontaine by stage, over a good Summer road.....32 "

From Bellefontaine to Sandusky city by railroad.....102 "

**FARE**—From Cincinnati to Lebanon.....\$1 00  
" " " Xenia.....1 50  
" " " Springfield.. 2 00  
" " " Columbus.. 4 00  
" " " Sandusky city 7 00

The Passenger trains runs in connection with Strader & Gorman's line of Mail Packets to Louisville.

Tickets can be procured at the Broadway Hotel, Dennison House, or at the Depot of the Company on East Front street.

Further information and through tickets for the Stage lines, may be procured at P. Campbell, Agent on Front street, near Broadway.

The company will not be responsible for baggage beyond 50 dollars in value, unless the same is returned to the conductor or agent, and freight paid at of a passage for every \$500 in value over that amount.

W. H. CLEMENT, Sup'l.

**BALTIMORE AND SUSQUEHANNA**  
Railroad.—Reduction of Fare. Morning and

Afternoon Trains between Baltimore and York.—The Passenger trains run daily, except Sunday, as follows:  
Leaves Baltimore at.....9 a.m. and 3½ p.m.  
Arrives at.....9 a.m. and 6½ p.m.  
Leaves York at.....5 a.m. and 3 p.m.  
Arrives at.....12½ p.m. and 8 p.m.  
Leaves York for Columbia at.....1½ p.m. and 8 a.m.  
Leaves Columbia for York at.....8 a.m. and 2 p.m.

**FARE.**

Fare to York.....\$1 50  
" Wrightsville.....2 00  
" Columbia.....2 12½

Way points in proportion.

**PITTSBURG, GETTYSBURG AND HARRISBURG.**

Through tickets to Pittsburgh via stage to Harrisburg.....\$9  
Or via Lancaster by railroad.....10  
Through tickets to Harrisburg or Gettysburg.....3  
In connection with the afternoon train at 3½ o'clock, a horse car is run to Green Spring and Owning's Mill, arriving at the Mills at.....5½ p.m.  
Returning, leaves Owning's Mills at.....7 a.m.  
D. C. H. BORDLEY, Sup't.  
Ticket Office, 63 North st.

**LEXINGTON AND OHIO RAILROAD.**

Trains leave Lexington for Frankfort daily, at 5 o'clock a.m., and 2 p.m.

Trains leave Frankfort for Lexington daily, at 8 o'clock a.m. and 2 p.m. Distance, 26 miles. Fare \$1-25.

On Sunday but one train, 5 o'clock a.m. from Lexington, and 2 o'clock p.m. from Frankfort.

The winter arrangement (after 15th September to 15th March) is 6 o'clock a.m. from Lexington, and ma. 9. from Frankfort, other hours as above. 35yl

**CENTRAL AND MACON AND WESTERN**

Railroads, Ga.—These Roads with the Western and Atlantic Railroad of the State of Georgia, form a continuous line from Savannah to Oothcaloga, Ga., of 371 miles, viz:

Savannah to Macon—Central Railroad.....Miles. 190  
Macon to Atlanta—Macon and Western.....101  
Atlanta to Oothcaloga—Western and Atlantic.. 80  
Goods will be carried from Savannah to Atlanta and Oothcaloga, at the following rates, viz:

	To Atlanta.	To Oothcaloga.
On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	\$0 50	\$0 75
Flour, Rice, Bacon in Casks or boxes, Pork, Beef, Fish, Lard, Tallow, Beeswax, Mill Gearing, Pig Iron and Grind Stones.....	0 50	0 62½
On Measurement Goods—Boxes of Hats, Bonnets and Furniture, per cubic foot.....	0 20	0 26
Boxes and Bales of Dry Goods, Saddlery, Glass, Paints, Drugs and Confectionary, per cubic foot.....	0 20 pr. 100lbs. 35	
Crockery, per cubic foot.....	0 15 "	" 35
Molasses and Oil, per hhd., (smaller casks in proportion). 9 00		12 50
Ploughs, (large,) Cultivators, Corn Shellers, and Straw Cutters, each.....	1 25	1 50
Ploughs, (small,) and Wheelbarrows.....	0 80	1 05
Salt, per Liverpool Sack.....	0 70	0 95
Passage—Savannah to Atlanta, \$10; Children, under 12 years of age, half price, Savannah to Macon, \$7.		

Goods consigned to the subscriber will be forwarded free of Commissions.

Freight may be paid at Savannah, Atlanta or Oothcaloga.

F. WINTER, Forwarding Agent, C. R. R. Savannah, Aug. 15th, 1846. 1y34

**CENTRAL RAILROAD—FROM SAVANNAH**  
to Macon. Distance 190 miles.

This Road is open for the transportation of Passengers and Freight. Rates of Passage, \$8 00. Freight—On weight goods generally... 50 cts. per hundred. On measurement goods..... 13 cts. per cubic ft. On brls. wet (except molasses and oil).....\$1 50 per barrel. On brls. dry (except lime).... 80 cts. per barrel. On iron in pigs or bars, castings for mills, and unboxed machinery..... 40 cts. per hundred. On hhds. and pipes of liquor, not over 120 gallons.....\$5 00 per hhd. On molasses and oil.....\$6 00 per hhd. Goods addressed to F. WINTER, Agent, forwarded free of commission. THOMAS PURSE, y40 Gen'l. Supt. Transportation.

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston, on the arrival of the boats from Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama. Fare through from Charleston to Montgomery daily.....\$26 50

Fare through from Charleston to Huntsville, Decatur and Tuscumbia.....28 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to Oothcaloga, a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer. Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAILROAD**

line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line.....9 o'clock a.m.  
Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars.....\$4 00  
Second class cars.....3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m. and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily except Sundays, at 8 a.m., 3½ and 10 p.m., and Sundays only at 10 p.m.—being a continuation of the line from New York. 25M

Saturday, December 11, 1847.

## A WORD TO ALL.

**Missing Numbers.**—We again remind our subscribers that we shall cheerfully supply missing numbers for the current and past volumes—if we have them to spare—on receiving a list. It is much more easy to supply them now than at any future period.

If we have omitted to comply with any of the applications heretofore made for missing numbers, it has arisen from inability at the time—not from indisposition—it may therefore be worth the labor of furnishing a new list, as we have received many loose numbers of back volumes, from which they may possibly be supplied.

## Intercommunication between the Atlantic and Pacific Oceans.

The Northern and Southern Routes.

We shall re-publish, at an early day, from "*De Bow's Commercial Review*,"—a very valuable work, published at New Orleans—an able article prepared by Mr. A. Whitney, accompanied by two maps, explanatory of the relative merits of the proposed northern and southern routes for a railroad to the Pacific. This article has been prepared with much labor, and it contains much valuable information, bearing upon the subject, not easily found in so small compass—and it will therefore be read with interest.

## Hamilton and Cincinnati Railroad.

The surveys preparatory to a final determination as to the particular location of the Hamilton and Cincinnati Railroad has been completed. The subscribers are paying quite promptly, and generally manifest a willingness to pay up, so that the entire line may be put under contract at once.

## Schuylkill Coal Trade.

## Richmond and Danville Railroad.

The friends of this road have organized, and chosen their officers, and it appears from the annexed notice of the meeting, which we take from the Richmond Republican, that they have decided upon an independent line, which, we suppose, means to have no connection with the "*Richmond and Ohio road*," as far as Farmville, or some other suitable place of divergence, as has been proposed or suggested by some, and very properly as we think.

It is much easier to talk about, than to accomplish such works in Virginia, and we therefore have supposed that it would be easier for the two companies to construct a line which should serve as a "common stem" or "trunk line,"—as they call it in England—for fifty or sixty miles, and then each take its proper course, than to raise the means to construct two distinct, and nearly parallel, lines the same distance; but it seems that different views prevail—at least so far as the friends of the Danville line are concerned,—and they have decided on "an independent line."

We do not assume, by any means, at this distance, to understand all the bearings of this subject, yet, looking at it from our peculiar position, we cannot but express our apprehension that this decision will operate seriously against the early completion

of either work. Indeed, if we look at the map rightly, and understand the relative position of places, we would suggest the following plan for the consideration of those interested in the two important works—viz: make a thorough examination of the country between Richmond and Prince Edward county, fixing the point of divergence at Farmville, or the Court House, or other suitable point, which shall be about equidistant from a direct line from Richmond to Danville, and from Richmond to Lynchburgh. Such a line would pass—at about 28 miles from Richmond—not far from the western termination of the Clover Hill railroad, which connects with the Richmond and Petersburg road. When the best line between Richmond to Prince Edward county was decided upon, would it not be good policy to commence operations, with the united means and energies of both companies, at the point nearest the termination of the Clover Hill road, and complete the work from there to the point of divergence in Prince Edward county, before the construction of that section of 23 or 30 miles from the termination of the Clover Hill road to Richmond? It appears so to us, in as much as the Clover Hill, and Richmond and Petersburg roads may be used—for the time being—to accommodate all the business which will be offered, not only until the main stem is completed to the point of divergence in Prince Edward county, but also until the diverging roads shall be in operation for many miles beyond that point.

In this way, it seems to us that, more advantages will result to the people of Virginia, with a given outlay of capital, and the ultimate completion of both works—and the extension of the Danville road through North Carolina—secured than by the course marked out by the friends of the latter road at their late meeting.

Of course these are views expressed without understanding the local bearings of the question, and must be taken for what they are worth. We go thoroughly, however, for a "main line" from Richmond to the Ohio river, and then for branch roads, in each direction, to all parts of the upper country where business requires, and capital can be obtained to build them; as such a course will, in time, again restore the "old dominion" to her relative rank in the union; but let her citizens adopt the course formerly pursued by Pennsylvania, of commencing many works at the same time, in detached parts, which cannot be connected, and made each to con-

tribute to the other, and it will be a long time before any one of them will be completed, and *longer* before those which may be completed will become profitable. These, however, are the views of a distant looker-on, whose only aim is to promote the greatest amount of improvement, and accommodate the greatest number of people, with the least outlay of capital.

"We learn," says the editor of the Republican, "that the meeting of the stockholders of the Richmond and Danville railroad company was organized on the 29th inst., by appointing Mr. Wm. H. Dennis, the Senator from Charlotte, to the Chair, and Messrs. — Hopkins of Danville, and James C. Crane of Richmond, Secretaries. The following gentlemen were unanimously elected President and Directors of the company:

#### PRESIDENT.

WHITWELL P. TUNSTALL, of Pittsylvania.

#### DIRECTORS.

Isaac Davenport, (also Vice President,) of Richmond.

Vincent Witcher, of Pittsylvania.

Lewis E. Harvie, of Amelia.

A. F. D. Gifford, of Chesterfield.

John A. Lancaster, of Richmond.

"The meeting, by an unanimous vote declared in favor of a 'direct, eligible and independent road.' It also, by an unanimous vote, refused to give instructions to the directors. The decision in favor of an independent line secured several subscriptions, which would have been otherwise withheld.

"No engineer was named; the election of that officer being left to the directors. The meeting adjourned Thursday night.

"It is added that the meeting was a large and enthusiastic one, and that a delegation was in attendance from Wytheville, which assured the meeting of the lively interest felt in that county, in Carroll, and other adjoining counties, in the Danville road, and of their earnest desire to connect the proposed road from the southwest with it."

#### Pittsburg and Ohio Railroad.

Or the Central Pennsylvania Railroad continued to the Ohio State Line.

The Pittsburg Gazette says that "the late election of the stockholders of the Pittsburg and Connellsville railroad company, by which we have an incorporated company, fully organized on an excellent charter, with powers to erect a railroad from Pittsburg to the Ohio State line, has given very general satisfaction to our citizens, and we look upon it as an era of no small magnitude in the history of the onward progress of our flourishing city. But in order that the advantages we now possess may be made available to our present and future prosperity, two things are essentially necessary—these are *immediate* action, and *united* action."

"That Pittsburg can build a railroad to the Ohio State line, by her own unassisted means and energies, cannot be doubted—that she *will* do it, we cannot permit ourselves to doubt."

Nordo we—if the people make up their minds to do it, and do it *at once*. It is of great importance to the Central Pennsylvania road, and to Philadelphia, that this road should be completed at the earliest possible period—or at least as soon as the Central road—as its construction will ensure the construction also of a railroad to Cleveland, and another westward through the State, and thus bring many of the Northern Ohio, Indiana, Illinois, and Southern Michigan merchants, for New York, through Philadelphia, who now seldom, if ever, come this way.

The Philadelphia Bulletin says of the Central

railroad that "this great enterprise continues to look most cheering, and we cannot but congratulate our fellow citizens on the happy settlement of the Connellsville question. By the dissolution of that company, the interests of Philadelphia and her sister city, Pittsburg, will be forever identified, and we rejoice to hear that its former president, Col. Robinson, has prepared a strong memorial to the authorities of Allegheny city to contribute half a million to the work, with flattering prospects of success. We hope this will incite our own districts to go and do likewise. So fully is the importance of its speedy completion appreciated by its friends, that several have volunteered additional subscriptions to double their original amounts. This is a wise policy, and if embraced by all, this great work may and ought to be finished by the first day of the new half century. On the same day—January 1, 1850—the New York and Erie railroad is to be opened; so say its friends."

And so *should* it be. No delay should be allowed which can be avoided by the most untiring diligence and perseverance. To Philadelphia, *time is very important*—one year's delay may be productive of great loss to her merchants, and may give time for the formation of connections, in other directions, which cannot be easily counteracted—and thus, for a long time, she may be deprived of the benefits of what may be considered legitimately her business; and therefore the *people* of Philadelphia, the property holders as well as the business men throughout the entire country, owe it to themselves to come to the aid of these works which are in a measure to change the current of business in their favor.

#### The Postmaster General and the Railroads again.

We have had occasion to refer several times to the controversy between Mr. Cave Johnson, and the Richmond, Fredericksburgh, and Potomac railroad, and Washington steamboat company. In our last number we gave some extracts from the official correspondence between the parties, on the subject, for the purpose of placing it fairly before the railroad interest of the country, as the present movement is evidently only the commencement of a system which is to be brought to bear, in detail, upon other companies.

We are induced to refer to this subject again, at this time, as we understand that the Postmaster General has taken the mails from the railroad—sending the *way* mail by wagons, and the *Great Southern* mail by the Bay-route, by steamboat; and if we are correctly informed, the cost to the department will be several thousand dollars *more*, instead of less, than has been paid.

The question has now assumed an importance which will command the attention of the business community, and we trust that it will be brought promptly before Congress, that it may be settled in a manner just, alike to the railroad interest, and to the department.

The following remarks are from the Richmond Republican, and give some details which may be useful to a proper understanding of the matter. The editor says:—

The public are already advised that the Postmaster General has refused to continue the compensation heretofore paid to the railroad and steamboat companies, for transportation of the mail between Richmond and Washington. We have looked a little into this matter, and feel no hesitation in saying that the Postmaster General is in the wrong.

We give all proper weight to cry against "monopolies," but there is nothing in the present case to justify a departure from the old adage that "it takes two to make a bargain."

The Postmaster General has assumed the position, that because the service is partly by railroad and partly by steamboat, he is restricted in reference to the latter, and estimates it at 12 1/2 per cent. less than the former. It seems, also, that since the contract, four years ago, and the award of President Tyler, in July, 1843, the department has required a *different* and much more *expensive* service, and at a lower rate. For instance, it has required a *shorter schedule*, by which the steamboat company is compelled to give up its *way-travel*, (said to be worth \$5000 a year) and has so fixed the hours that it requires *two* ice-boats instead of one, and *two* sets of cars *daily*, for the new service.

It is truly stated by the directors of the railroad company, that "the service on the railroad has been performed during the *whole* of the last seven years with so much punctuality and exactness, that a failure of the mail has very rarely occurred, and when one has occurred, it has so evidently resulted from unavoidable causes, that a *mail fine* has in no instance been imposed on the railroad company within that time. Indeed, the regularity referred to has been a matter of great surprise to the public, when the length of the line is considered, and the fact that it is partly by steamboat and partly by railroad. No one who travels the route, can fail to notice the great increase of the mail in bulk, or the notorious fact that the ice-boats have overcome all difficulties, at a greatly increased expense.

Formerly, 11 hours were allowed in one direction, and 11 1/2 in another. *Now*, only 9 hours are allowed one way, and 9 1/2 the other. This necessarily compels the steamboat line to give up its hitherto profitable *way-travel*. It is estimated, and we have no doubt correctly, that if conveyed by the old mode, the present mail would often require two lines of wagons, and some *fifty teams* of horses each; and then think of the *difference in the time*!

The board of directors are unquestionably right in their construction of the law of 1845, and are sustained in it by eminent counsel, that *no distinction* is made between the *railroad* and *steamboat* portions of a railroad and steamboat route. The suggestion of the department, that there is no road north of the city of New York which receives anything like the amount offered on this route, for even double and triple daily service, is entitled to no weight. It is forgotten that the amount of travel on these northern routes is at least *triple*, and that therefore the business is conducted at less expense.

But, to cut the matter short, the people will not stand Mr. Johnson's construction. If he should attempt to send the great mail between Washington and Richmond by the *old mode*, he will soon have *no mail to carry*. He cannot prohibit, nor can Congress, an express to carry packages by the railroad and

steamboat line. The Constitution of the United States gives Congress power to establish post routes, but it certainly does not prohibit individuals from carrying any thing they please—and in the present age of "progress," the people will not submit to *snail-like* conveyances, even to put down "monopolies," nor to aid Mr. Johnson in his favorite system of economy.

It is time the public voice should be heard. The Postmaster General has not only undertaken to reduce the allowance formerly awarded by the President, but he now contends for a *still greater reduction*, whilst the service is unquestionably much enhanced. The average weight of the mail going south from Washington, for five days, in June, was about 3,000 pounds, and the largest 5,200 pounds. During the sessions of Congress, it is greatly increased, and before the completion of a *four years* contract, the progress of affairs may make it more than double what it is at present.

We hope the companies which have heretofore accommodated the public so amply, will take prompt measures to accommodate them still, by carrying newspapers and letters by expresses. Any arrangement of the Postmaster General, to consume *twenty four hours* instead of *nine*, will assuredly fail. The public are accustomed to *speed*, and this they must have under all circumstances.

We think the Postmaster General will find himself at greater expense than heretofore, and will fail to accommodate the community as desired.

#### Northern, N. H., Railroad Opening.

The Northern railroad, from Grafton to Lebanon, N. H., was opened on Wednesday, the 20th of November. A large party of stockholders and invited guests went from Boston in a special train. The road has been in operation for some time past, as far as Grafton. From that point the line of road is through Orange, Canaan, and Enfield, to the village of Lebanon, within about five miles of the Connecticut river, and its proposed termination, where, at the mouth of the White river in Vermont, it will connect with the Vermont Central road, and with that and the Ogdensburg road, form a continuous line from Boston to the waters of the St. Lawrence at Ogdensburg. The completion of the road from Lebanon village to the Connecticut river, together with the construction of a truss bridge about 600 feet long, over the Connecticut—will be effected in season for the opening of the Vermont Central road to Northfield, and perhaps Montpelier, by the 4th of July next.

The line of the Northern road will be 69 miles, from the Merrimac to the Connecticut. It passes over a rough and forbidding country, and severe natural obstacles have been overcome in its construction. It is just two years since the work was commenced.

How little the people of the quiet village of Lebanon thought of a railroad the last time we were in their midst—on the 4th of July, 1819! The shrill whistle of the locomotive had then never been heard nor thought of, even in *old*, much less *New*, England; whereas now, as Mr. Webster pleasantly remarked, the people in every little village, and even the farmers in all parts of the country, think they must have a railroad that they may "ride behind the iron

horse, in those long wagons—to see each other—to carry their produce to market—and they *will have it*."

It was a proud day for the people of that vicinity, and the visitors from Boston must have enjoyed it exceedingly, notwithstanding the little accident on the way, and the delay of their dinner in consequence.

"The train arrived at Lebanon at about 5 o'clock P.M., being somewhat delayed by accidents. There were thousands of the people assembled: and we almost thought as we approached the depot, and saw so many to welcome us, with hurrahs and shouts, that all New Hampshire had congregated there.—They were there to welcome those who came in the train—to congratulate them upon the success of that great and bold enterprise, which united western New Hampshire with Massachusetts.

"The place was filled by the crowd who were in waiting at Lebanon, and those who had arrived in the train. The refreshments were provided by the citizens of Lebanon, as an expression of their joy at the completion of this great enterprise, which promises to be so advantageous to them. May all their hopes be more than realized. When all the crowd had entered, the chairman for the evening, Mr. Lathrop, of Lebanon, bade all a hearty welcome. He was highly gratified to see so many friends coming to the celebration. He knew the road had *many* friends, but he did not think their number was quite so large; still, he was glad to see them all, and hoped that all would have enough. He said that the latch string hung out everywhere, and if there was not enough in New Hampshire, their neighbors in Vermont would supply them. He then invited his friends to fall to, which they did with a good will.

"After the repast, Gen. Nesmith, of Franklin, the president of the road, set the speaking a-going with a few excellent remarks, in regard to the difficulties met with, but all now vanished, and said that he was amply repaid for all his trouble by the success of the enterprise, and the happiness of the company present.

"Charles T. Russell, Esq., of Boston, a director of the road, then, in a few very neat and appropriate remarks, alluded to the presence there of one whom all would be delighted to see and hear. One who had been the steadfast friend of internal improvement, through whose farm this railroad went, connecting the home of his adoption with the home of his nativity, (Boscawen) and his Alma Mater (Dartmouth college, in Hanover.)

Mr. Russell closed with the following sentiment:

"The Honorable Daniel Webster, happily present with us to-day—Too ardent in his love, too eloquent in his defence of our glorious Union, ever to fail to sanction and commend those internal improvements which tend to cement and perpetuate it."

"Mr. Webster arose, amid deafening cheers, and nowhere was he ever receive with more enthusiasm. The crowd was so great everywhere, that it was impossible to find a place where to write, so that we can only give a

slight sketch of his remarks. Mr. Webster alluded to the great interest he had always taken in railroads, and particularly this. It was one of peculiar interest to him; it passed by his own door, through his own farm, and through places with which he had been connected all his life. He admired the enterprise of the people in constructing it. The importance of the road was not only to the people along its route, but as a connecting link in still mightier enterprises. This road, here determined, connected Vermont and Montreal, Central Vermont, the Connecticut and Passumpsic. At this point it gave the traveller the choice of routes to other extensions; and he would further remark, that connected with the St. Lawrence and Ogdensburg railroad, it would tap, or rather it would relieve, the St. Lawrence of part of its burthen.

"By its greater speed, it will bring Ogdensburg as near to Boston as Albany to Buffalo, and it would soon bring lake Superior down to Massachusetts.

"Mr. Webster continued: New York was pre-eminent over other cities by its situation and its foreign commerce. He did not envy her—he would not undertake to compare the *town of Boston* with the great commercial emporium of this country and this continent; but he would say, that if he stood upon the top of Bunker Hill Monument, he could look off upon a population and a business very nearly as large as New York and Brooklyn and its vicinity. Boston and its vicinity extends to Newburyport. The whole Essex shore was one city, and they did certainly a larger business than New York. Boston, with the aid of the country, without anything like the actual advantages of her sister city, had made herself a rival not to be despised; and he would not undertake to calculate the extent of her commerce, when all the links of her railroad chain were completed. They would soon have a railroad to New York and Long Island Sound, by New Haven and the Connecticut river. People, he continued, were apt to speak of New England land as poor. Some of it is poor, but some of it is good. There is a great deal of land which is worth \$250 for cultivation, and that cannot be so very poor. New England is rich in its enterprise, rich in its products, in its power of human energy, and in its water powers, and in its application to them of machinery.

"The great chains of railroad traversing New England, were evidence enough of the enterprise of the people. They themselves had accomplished a great and difficult enterprise in bringing this road there; they had split the Grafton rocks, connected his home with their home; but what did all this? He would tell them it was natural result of free schools, free thought and free labor. FREE LABOR has done it."

We have not room for the entire proceedings, nor even for the whole of Mr. Webster's remarks, but the following are too true to be omitted. Mr. Webster said:

"By the original treaty of 1763 the boundary line between the British possessions in North America and the United States was

traced along the St. Lawrence and the great lakes and the forty-fifth degree of north latitude. It pursued the middle of the river and the lakes. It was a fixed geographical line and was run out by two or three commissioners. But it so happened, according to this boundary, that the vessels of the two nations could not navigate some parts of the St. Lawrence and the upper lakes without trespassing upon the territory of the adjoining power. The American could not conveniently navigate from lake Erie through lake Huron, without traversing a part of the Canada waters, while, on the other hand, in the long saw of the St. Lawrence, the channel and the deep water were on the American side. For all purposes of jurisdiction it was well enough to let the line remain as it was; but for the purposes of navigation it was quite obvious that the river and the lakes should be open to the ships of both nations from shore to shore. This was accordingly provided for in the treaty of Washington. The stipulation was opposed, in some quarters, as being a surrender of American soil to British invasion, but happily it was ratified; and he believed that every body was now convinced that the provision was beneficial.

"His friend had touched upon another topic—the great subject of internal improvement. Why, what in the world was government instituted for, except for internal improvement? Certainly not wholly or chiefly to regulate the external relations of nation and nation. Such relations were frequently those of war, of hostility. But government was not made for war. At present it was true, there were extended commercial relations between different countries, but they were only one branch, and that not the most important branch, of affairs to which the attention and care of government should be devoted. He took it that all really good government was established to do that for the people which needed to be done, and which the people could not do for themselves. Government should be merely the united, the concentrated force of the people; and therefore, *a priori*, it was the duty of government to consider whether that thing which was necessary to be done, could be done without governmental aid; if not, the presumption clearly was, that government ought to grant that aid and do that thing. Such had always appeared to him but a fair interpretation of the duty of government; and the propriety of this view he thought clearly appeared from another consideration. New Hampshire could not collect a dollar from any custom house within her limits; Massachusetts, one of the great commercial States, could not collect a dollar from any of her custom-houses. All the financial benefits of the entire commerce of the country accrued to the general government. Most certainly, then, it was for the government to provide for the necessities of commerce. Did it require the protection of forts, of lighthouses, of piers, of breakwaters, who but government was bound to grant that protection?

"Take the case of the breakwater in the Delaware, a work opposed for twenty years

upon constitutional grounds, though happily without effect: who was to expend a million of money on that? The little State of Delaware? She had no interest in the matter—at least no exclusive interest—not one-quarter as much as the city of Philadelphia.—Should it be Pennsylvania or New Jersey?—Neither was alone interested in the work. Maine, New Hampshire, Massachusetts, all New England, was as much concerned in that improvement as any part of the country, and in fact more so; for New England was more interested in the navigation of the Delaware than was any other region, and New England vessels were more likely to be wrecked there.

"Take another instance—the work projected in the harbor of Mobile some years since. It was opposed by the representatives of that very region, but he had voted for it throughout. Returning from Washington at the close of a session when the measure was unsuccessfully urged, one of his constituents, a little vexed at the course of proceeding, had asked him how he could support a measure which was so strenuously opposed by the very people it was most designed to benefit. His answer was ready: because, during the two or three years before, there had been several Massachusetts ships lost there—so true it was that the whole country was concerned in the improvement of any of its parts.

"But he supposed that allusion was more directly intended to that branch of the system of internal improvement which regarded canals and railways.

"Happily it had happened that, thus far, private enterprise and wealth had been able to accomplish, in this respect, about all that was necessary. And there could be no doubt that what could be accomplished by private enterprise was done more economically and to better advantage than in any other way. So far, therefore, as private enterprise could carry out a work of improvement, the much wiser course was to rely upon it. But with regard to the improvement of the western waters, this was not the case. The aid of government was necessary here. Every one knew that all such improvements had always been resisted, and he had heard a grave constitutional argument advanced against them that nature never made any harbors on the lakes, and therefore it was clear she never intended there should be any! To which he remembered to have replied that, so far as he knew, people were brought into the world without being clad, and therefore the argument was good that they never should wear clothing.

"The great western lakes were not a straight line of water. They pursued a zig-zag course. We beheld lake Erie stretched down into New York, as if to accommodate, especially, a comparatively southern region. We saw another of the chain reaching far into the northwest, to accommodate that region. Whoever would look at the map must see at once that nature intended the lakes for the benefit of vast, different and distant portions of the country. But it was a remarkable fact that there were but a few natural har-

bors on the lakes. What then should be done to improve the advantages offered by these immense sheets of water? The science of the age told us at once that it was expedient to construct harbors, but how were we to do it? He would not weary the company by going over what had been said on this subject for the past twenty years, sometimes with a degree of sprightliness, but oftener to tedium, from its earliest agitation to the days of the Chicago convention, and particularly the Memphis convention—a body, some of whose very distinguished members, though they could not dig a trench for a canal, or split a rock for the passage of a railroad, could yet skilfully split hairs for the sake of establishing a mere theory upon a mere abstraction. But for himself, he would say that he had always considered it as much a duty of government to improve and establish harbors on the western waters as to build a lighthouse in the harbor of Boston.

"With regard to railroads, there were two considerations which should not be overlooked. First, that they enhanced the value of property everywhere in their vicinity. In the course of a journey he made last year he passed over the railroad to Wilmington, N. Carolina. Along that line the people raised considerable corn, and produced some lumber, terpentine and the like. The road was violently opposed at first as an encroachment on private rights. It would cut down the pine trees of the people—it would take away their soil. He was made acquainted with a gentleman who had electioneered against the road, year after year, and had actually been elected to the State legislature on the strength of his opposition to the project. But the charter was granted, and this very man, in the course of conversation, admitted that since the road was opened, and he had found a market at Wilmington, he made more money by selling his hens and chickens and eggs than he before derived from the produce of his whole plantation. So much for one instance of increase in property caused by a railroad. Again, railroads serve to connect men and societies together. Every road that was built did much in this respect. In a pecuniary sense it was advantageous, but in this sense it was of still greater importance. All these enterprises formed bands of individual, social and political union between the people and the States, and the more of them there were the more would such ties be strengthened. They broke down the barriers of distance between persons and communities;—they promoted intercourse between man and man; they brought about more intimate and more just social relations—the true basis of just political relations. When we found men alike in character, following substantially the same pursuits, closely connected, individually and socially, we should there find the true foundation and basis of political union—such an union as alone can be the salvation of the States of this country."

The States of New Hampshire and Vermont have not, until recently, engaged in the construction of railroads, with spirit and a determination to avail themselves of their great advantages. Things how-

ever have changed, and we have not a doubt but that those States will have, within a few years, as many miles of good railroad, in proportion to their territory, as any of the States in the Union. At last three lines of railroad—emanating from Boston—will traverse those States diagonally, together with the numerous branches, and connecting links, sure to be constructed for the accommodation of towns and villages not on the main lines, and also besides a central line parallel with the Connecticut river, to, or nearly to, its source. The Portland and Montreal road will also cross their northeastern borders, and there will be a connecting link between the Rutland and New York and Massachusetts railroads, on the west side of the mountain—thus bringing every town and village, of any considerable business, into immediate, or near, connection with a railroad. This is sure to be the case for the reason assigned by Mr. Webster, viz: "that they enhance the value of property everywhere in their vicinity;" and, as the North Carolinian said, because he can make more money from his hens, chickens and eggs at Wilmington, than from his whole plantation before the road was made.

#### **Pennsylvania Railroad—First Annual Report.**

We have received a proof-sheet of the first annual report of this company. It is written in a business-like manner, and shows that the Directors have done their duty like men of business, whose whole aim has been to accomplish the object in view in the shortest possible time. It is not yet nine months since the company was organized and its officers chosen, yet they have put over seventy miles under contract, thirty of which is in a state of progress, quite satisfactory. And what is equally gratifying, they have nearly one million of dollars on hand—with which to push the work during this winter.

We have neither time, nor space, in this number for comment, but shall take an early opportunity of referring to the subject again.

#### **First Annual Report of the Directors of the Pennsylvania Railroad Company, to the Stockholders.—October 30, 1847.**

To the Stockholders of the Pennsylvania Railroad. GENTLEMEN,—The period has arrived, when under the provisions of the nineteenth section of the charter of the company, the Board are required to present to you an account of their proceedings before surrendering to you the trust which has been confided to them.

Upon entering on the duties assigned to them, in the prosecution of a work of such magnitude, in which their fellow citizens hold a deep stake, and in which the future prosperity of the city is largely interested, the Board felt their responsibility, well knowing that a false step at the commencement would damp the ardor of its friends and jeopardize its final success.

Earnest consideration was therefore given to the most effective organization of the engineer corps, upon which success in a great measure depended, and the Board determined to place that department under an efficient head, who should control the whole, with two associates, to have charge under his direction of the two divisions of the road respectively.

In the selection of a chief engineer, the Board were fortunate in obtaining the services of Mr. John Edgar Thomson, a gentle-

man of enlarged professional experience and sound judgment, who had obtained a well earned reputation upon the Georgia road, and in whom the Board place great confidence.

The office of associate, west, was filled by the election of Mr. Edward Miller, a gentleman well known and appreciated in this community, who has occupied several prominent positions in his profession, with entire credit to himself, and enjoys the merited confidence of all companies who have employed him.

As associate, east, Mr. Wm. B. Foster, jr., was appointed, a gentleman who has for years filled important stations, in connection with the state works, and who has proved himself an able and efficient officer.

The experience of the past summer has satisfied the Board that in the organization of this department they have nothing to regret.

The Board at an early day turned their attention to an object, which they deemed it incumbent on them to secure if possible, for which their constituents had manifested great solicitude, and took immediate measures to prevent the Baltimore and Ohio railroad company availing itself of the law passed by the Legislature of this state, granting to that company the right of constructing a road from Cumberland to Pittsburgh.

To effect this a subscription to the amount of three millions of dollars, and the payment of one million into the Treasury of the company, were required by the Act of Assembly, and to have fifteen miles of road put under contract for construction at each terminus of the Pennsylvania railroad, prior to the thirtieth of July, 1847. The instalments were therefore called payable on the first days of May and July, and were promptly met by the stockholders. These instalments, with that already paid at the time of subscription, amounted to nine hundred thousand dollars, and the deficiency was met by payments in anticipation of the fourth instalment from stockholders, who came promptly forward to a sufficient extent, some of whom paid up their stock in full.

In the month of July, contracts were made for the construction of the road the required distance, and on the second of August, the Governor issued his proclamation, declaring the law giving to the Baltimore and Ohio railroad company the right of way through Pennsylvania null and void.

The good effect of this measure upon the general interests of the company has been made strikingly manifest, by putting it in the offset in a state of high credit, and by imparting to it a public confidence which cannot fail to facilitate future subscriptions that may be necessary for the completion of the road.

The policy to be pursued by the Board in the management of this was plainly indicated.

The law requiring fifteen miles at each end to be put under contract was fulfilled, but at this point so unwise a course stopped.

With this exception, the attention of the Board was directed to the eastern end, with

a view of bringing into profitable use that portion of the road which would soonest make a return to the stockholders.

An examination of the different routes which had been indicated by former surveys and public opinion, led irresistibly to the conclusion that the Valley of the Juniata was on all accounts to be preferred, presenting greater facilities, easier gradients, and less distance, with the decided advantage of being brought into profitable use at a much earlier period than either of the others.

Accordingly it was determined to adopt and place it under contract as rapidly as it could be prepared by the engineers. Twenty miles were let in July, which are now rapidly progressing towards completion. Forty miles further to Lewistown will be let to contractors on the twenty-sixth of November, and the engineers are now actively engaged in locating the line, with a view of placing the remainder of the eastern division to the base of the mountain, under contract early in the Spring. As soon as the engineers have completed their operations, a report from the chief engineer, with an estimate of the cost, will be made and published for the information of the stockholders.

The surveys and location of the western division cannot be completed until early the ensuing summer, but sufficient information will be obtained from the surveys of this year to enable the engineers to give an estimate of the cost of the whole road, with considerable accuracy. The line of the road upon the eastern side of the mountain has been finally determined, and proves highly favorable. The whole length of the road from Harrisburg to Robinson's bridge, at the foot of the Allegheny, is one hundred and thirty-five miles, upon which there is no ascending gradient exceeding sixteen feet per mile to Lewistown, and twenty-one feet for the remainder of the distance, nor a descending gradient exceeding ten and a half feet per mile.

From Robinson's ridge, which divides the little Juniata from the Frankstown branch, north of Brush Mountain, the ascent of the Allegheny is commenced, and overcome (with the use of locomotive power) by a gradient of about eighty feet per mile in thirteen miles, without encountering any extraordinary difficulties. This work will be left for a future period, and in the mean time a junction will be formed with the Allegheny portage by a branch line, six miles in length, from Robinson's ridge to Hollidaysburg, or some point further west. From the summit of the Allegheny to Pittsburgh the line will pass over an uneven country, requiring maximum gradients of fifty feet per mile in both directions. The whole length of the road from Robinson's ridge to Pittsburgh will fall somewhere between one hundred and ten, to one hundred and twenty miles.

The general plan determined upon by the board is to proceed with the western section as soon as the eastern division is complete, unless means are provided to prosecute both simultaneously, and to bring them into use by connecting with the Allegheny Portage

while the mountain or middle division is in the course of construction.

From present prospects, the board anticipate being enabled to run their cars from Harrisburg to Lewistown before the close of the winter of 1848-49, and the winter following, with the means now at their command, to connect with the Portage at Hollidaysburg, which, with the completion of the western 15 miles, will give a continuous railroad communication between Philadelphia and Pittsburg, with the exception of 55 miles to be travelled by stages; and the board anticipate at that time a very large proportion of western travel over the road.

The importance of securing a supply of iron in time early engaged the attention of the board, and they were desirous of obtaining it from the mines of Pennsylvania. With this view, they offered to contract for a sufficient amount to afford an inducement to erect new iron works for its manufacture.

After some negotiations, they finally closed with the offer of David Reeves for 15,000 tons, the amount required for the eastern section, at \$60½ per ton, being about \$10 per ton less than the market price at that time on the seaboard. The amount required, and prospect of future orders, determined the bid, which was considered a very advantageous operation for both parties. Mr. Reeves has commenced the erection of his works in Lancaster county, and will be prepared to deliver iron in the month of June next, being the time it will be required for the track.

Since the period when this enterprise was first undertaken, a marked change has manifested itself in the public mind with regard to its feasibility and prospects of profit. At that period the subscription to the stock was considered by many as a patriotic endeavor to retain and extend a trade which legitimately belonged to this city, and which was about to be wrested from her grasp by her enterprising rivals.

A glance at the subscription book attests the existence of this feeling, for out of some 2800 subscriptions near 1800 are for 5 shares and under. The books at that time were carried from house to house by the active friends of the road, who solicited even single shares, and the powerful aid of public opinion was brought to bear upon the city authorities to induce a large subscription, lest private enterprise should be inadequate to the task. Of the importance of the work to the true interests of the city and State no one ever entertained a doubt. If any had been entertained, the recent disaster to the State public works of Pennsylvania, must have removed it.

In a single night, the whole range of canal along the Juniata was swept by the flood; more than 20,000 tons of goods in transit left along its banks, to be wagoned east and west at a heavy expense, and the channel of communication between the east and west interrupted for near two months, leaving the country full of produce, coal and iron, unable to find an outlet to market for the next 6 months and materially interrupting the business prospects of the merchants both of Philadelphia and Pittsburg.

Such an occurrence, which the canal must at all times be subject to, has awakened the attention of the whole country to the necessity of pressing the work forward with the utmost vigor.

As an investment, this work is now viewed in a very different light from what it was a year ago.

Since the road has been seriously undertaken, with an earnest determination to bring it rapidly to a completion, its prospects have been more carefully scrutinized, and every fact which has been developed in the public prints, has gone to show that when in operation, it has a field open to it which no other enterprise of the kind presents.

Already the citizens of Ohio are combining their energies to extend our line through the fertile valleys of that State, and form a continuous way from the Atlantic to the Far West. Even from Pittsburg alone a vast trade must open to it, which has never been taken into account, in the single item of cattle, of which more than 50,000 are annually driven through Pennsylvania from Ohio, and which can be transported over the road at a large saving to the drover, yielding abundant profit to the company.

That the Pennsylvania railroad must yield an immediate profit on the investment is generally admitted by all well informed persons and we may now look to capital seeking investment, and not to patriotism to furnish it.

The manifest advantages to be derived from an early completion of the whole line call for a recommendation from the board that immediate steps be taken to raise sufficient capital to render it available in the shortest possible period.

The amount now subscribed exceeds three millions of dollars, which, it is safely calculated, is sufficient to put the road in operation to the base of the Allegheny, and connect it with the State Portage. This portion of the work is now being constructed as rapidly as is consistent with judicious economy.

The western section may be considered as a distinct work, and can, without detriment to the interest of the company, be put under contract at the same time as the eastern, thus effecting a saving of nearly two years in the completion of the whole. An united effort should, therefore, be made both in the east and the west, in order to enable the board to commence the work as soon as the surveys are complete.

It is fortunate that the unfriendly feelings which divided us from our western fellow citizens have been allayed, on both sides by time and calm reflection. Both parties now see that their interests are inseparably united and we have the strongest assurances from prominent persons who were most active in forwarding other interests that they are ready to unite with us, and give their hearty co-operation. Measures are now in progress in Pittsburg which it is hoped will lead to a large subscription from the citizens and authorities of Allegheny county.

To place the company in a strong position and unite all interests to its behalf, some legislation will be important, which, it is sup-

posed, will not be difficult of attainment, as many interests which heretofore were adverse will now act in accordance with the wishes of the company.

A careful examination of the law will be made prior to the ensuing session of the legislature, with a view to such minor changes as will add to its efficiency. The board now call the attention of the stockholders to two important amendments for their sanction.

One, which will materially affect future subscriptions, is the supplement presented and asked for at the last session, granting to municipal bodies the right to subscribe to the stock of the company, a law which would, under certain restrictions, give the company the right to accept the certificates of loan issued by municipal corporations in payment of instalments for stocks will have a most beneficial effect upon our subscriptions.

The tenth section of the charter of the company provides, that after bona fide contracts shall have been made for the immediate construction of 15 miles of road at each end thereof, a sum equal to five per cent. per annum on the capital stock of said company actually paid in shall be estimated and paid to the several holders thereof, on account of the amounts payable by them respectively for stock subscribed, to be charged to the cost of construction.

This clause was doubtless intended by the legislature to place the original stockholders upon a just footing in point of interest on their capital with those who might subscribe at later periods, who would otherwise participate equally in advantages accruing from the early subscriptions of their more enterprising neighbors. This intention was equitable, and tended to induce early subscription but does not meet the exigencies of the case.

The consideration of this clause has led to an inquiry into the policy of paying interest upon all subscriptions semi-annually in money, from the day the instalments are required to be paid, with a view not only of inducing subscriptions, but also of placing all stockholders upon equal ground. The objection that may be urged, that the company will pay out as dividends that which it has not earned, will not bear the test of scrutiny.

It is perfectly true that the company has earned no money to divide; but, whether the interest upon the capital paid in while the road is making is sunk, or appears only on the private books of the shareholders, or whether it is credited on the books of the company on account of future instalments to be paid, or whether it is actually paid out, and new stock subscribed to meet the demand, the effect is the same. For in either case interest is an element in the cost of construction, and must be added to the capital expended. By this latter course the effect produced is, that the capital stock, when the road is finished, represents exactly the cost, principal and interest, and every shareholder, early or late, is placed upon the same footing.

In considering this question, it is well to take warning from experience, and compare the practice in Pennsylvania with that of other states.

The large public works of this state constructed by private means, it is believed, almost without exception, have been undertaken upon inadequate capital. Their projectors have raised sufficient funds by subscription for the commencement, and trusted to loans, at fixed interest, for the completion, hoping to obtain sufficient profit to pay off the debts and give excessive dividends to the shareholder.

The result of this policy has been almost universally a disappointment. The property of the stockholders has, in many cases, been sacrificed to pay an interest to loanholders. Money has been raised at usurious interest by the sale of bonds below their par value; and in cases where the works would have paid a fair remunerating profit if they had been constructed at their fair cash cost, they now labor under an accumulation of debt, which absorbs all the profit of the concern to pay the interest. Hence it is that capitalists in this city are backward in entering into new projects of public improvement, as their confidence in success and early returns is much shaken [by the policy which has heretofore been pursued.

The example drawn from the practice here should be avoided, and the Pennsylvania railroad carried through upon its legitimate capital without debt, and this can only be accomplished by the payment of a moderate rate of interest to shareholders, during the progress of the work. Parties may not be found to the required extent who are willing or able to forego their income, while so large a work is in the course of construction, but if an income is regularly paid, any reasonable amount of capital may be obtained for a road which must, when finished, pay a remunerating profit.

It is fortunate that our work is of such a nature that it will not long require the exclusive use of capital to pay the interest, because every section, when finished, will bring in immediate returns in aid of the interest paid. A considerable profit will accrue when the road is in operation to Lewistown, and in another year, when it is connected with the state road at the Allegheny portage, the income will be still further increased in proportion to the cost, and it is doubted, whether the semi-annual payments for interest will ever prove a very serious burthen.

The line of policy now recommended by the Board, is to ask the passage of an amendment to the charter, requiring the company to pay semi-annually an interest equal to six per cent. per annum upon all instalments as called for, (a charge of one per cent a month, being now provided upon delinquencies,) which interest is to be charged to cost of construction, and to credit the same account with all earnings until they amount annually to a sum sufficient to pay dividends to that amount.

In recommending the payment of interest, the Board do not propose any new experiment. This plan is sanctioned by the practice of English companies, as well as those of New York and Massachusetts, and has been followed by the beneficial results.

Although it is understood that no provision exists in the charters granted in these states for the payment of interest, yet for the last six years such payments have been voluntarily made by all companies, under a conviction of the policy and equity of the measure, and it is found that it not only has the advantage of securing prompt payments from the stockholders, but it permits persons of limited means to invest in these stocks, with a certainty of receiving their income regularly from the time of such investment.

The ultimate effect has been that all the roads but one in Massachusetts have been built upon their capital stock, only a single company have been obliged to have recourse to loans, to complete their road.

In New York it is understood that the same course obtains, and that the Hudson river company pay to the shareholders an interest of seven per cent. as the work progresses.

In looking forward to the trade likely to accrue from an extension of the Pennsylvania road to the west, and in view of meeting the efforts that might be expected to divert that trade, the board thought it expedient that a committee should visit Ohio during the past summer, in order that they might understand the interests that would probably be brought to bear upon their future prospects. Accordingly they delegated Messrs. J. R. Ingersoll, Ralston, Spangler and Cresson, as a committee for this purpose. The report of that committee was highly satisfactory, and a correspondence was opened by them with intelligent and enterprising citizens, interested in works of internal improvement in various parts of the State. From the inquiries of the committee, it is understood that an active spirit of enterprise has been awakened in that State, and that the most strenuous exertions are making to reach the Atlantic by railway communication.

The enormous increase of trade consequent upon the demand for provisions and bread stuffs upon the Atlantic coast for shipment, has satisfied their citizens that channels of communication, liable to interruption for a large portion of the year, will not meet the demands of commerce, and hence their attention is turned to means of transportation upon which they can rely with certainty at all seasons.

Two great chains of railroad are contemplated through the State of Ohio, towards which decided measures have been taken.—The first and most forward in its prospects, is that leading from Cincinnati through Columbus, and thence eastward till it touches the Ohio river, at some point where it can connect with a railroad to the seaboard.

This road connects with the Cincinnati and Sandusky road, which is already in operation as far as Xenia, or Springfield, and passes through Columbus and Newark, to the mouth of Licking river. From this point two routes present themselves, one to Wheeling through Zanesville, and the other in a northeastern direction, till it strikes the river about Wellsville. The road for a part of the distance is

in the hands of organized companies, who will carry on their work by local means, until they come to the point of divergence.—This road is of too important a character to stop at such a point, as it will bring over it for a large part of the year most of the travel south of Cincinnati. Its movements from the mouth of Licking river must be governed by the probability of reaching the Atlantic in the shortest probable period. The tendency of trade from the country through which this road passes, is from long habit to Baltimore, a tendency created by the existence of the national road, and if, on arrival there, it shall be seen that the Baltimore and Ohio road is likely to reach the river first, the probability is in favor of the Wheeling route. If on the contrary it shall appear that the Pennsylvania road can first be finished, we may look with confidence to its being the recipient of that great trade.

In taking Columbus as the starting point, the distance estimated to Philadelphia is a few miles less than via Wheeling to Baltimore, and as the mass of travel tends to the north, the distance between Baltimore and Philadelphia is saved to the traveller. It is believed to be a fact, that four-fifths of the through travel over the Baltimore and Ohio road, take the line to Philadelphia without stopping at all in that city.

With such a prize as the southern Ohio trade in view, the energetic prosecution of the Pennsylvania road is of the utmost importance as our success depends upon rapidity of motion. An additional argument is brought home to every stockholder to induce him to assist in placing the company in a position to prosecute the western section simultaneously with the eastern.

Still more important to the interest of this road is the Central or "Back-bone" line, as it is aptly termed, through the table lands of Ohio, which has been projected and is in a fair way of prosecution.

This road will traverse almost in a straight line, the rich bed of wheat lands which extends through the whole State, and embraces a fertile and thickly populated region, and crosses every railroad that can be made from the south to the lakes. The movements towards the construction of this road have already commenced with spirit, and will be conducted with energy.

The country which it traverses is sufficiently populous and rich to make it, and from the peculiar topography of that region, its cost will be moderate and its profits large. It is difficult to appreciate the extent of trade and travel that it will control. It commands a vast amount of trade which now finds its way to the lakes, and borders for its whole length, the rich grazing country of the north of Ohio.

From its geographical position, this trade must come to Philadelphia, and may be looked to with confidence, both as a profit to our road and an increase of the trade of the city. Already a portion of it from Wellsville west is under contract. Charters exist which will cover a large portion of the ground, and application will be made to the legislature of

Ohio during the ensuing winter, to connect these charters, so as to give the whole line from the eastern to the western borders of the State, into the hands of one company, who will at once commence their operations.

In view of the construction of these roads, which are destined at a very early period to throw upon the Pennsylvania railroad a trade of great magnitude and value, the board turned their attention to the connection which must be made between their western terminus and the Ohio State line, and being satisfied that the true policy of the citizens of Pittsburgh is to unite cordially and with their whole strength in the completion of the road connecting the two cities, they took upon themselves the responsibility of guaranteeing to their fellow citizens of that city that this connection should be made as soon as the requirements of the trade should make it advisable. And they still hope that the same view will be taken by our brethren of the west, and they will yet receive their hearty co-operation.

The treasurer's report, herewith presented, will exhibit the state of the finances. Balance in hand, \$953,303 86.

It is hoped that, with the new contracts about to be made, they will soon be able to expend these funds with rapidity. No calls will probably be made until the ensuing spring, of which due notice will be given.

The board have to regret the loss from among their number of an ardent friend of the road, Henry C. Corbit, Esq., who was compelled to resign in the month of May from ill health. The vacancy was filled by the election of Jesse Godley, Esq., on the seventeenth of that month.

In surrendering this important trust to their constituents, the board cannot refrain from mutual congratulations upon the auspicious commencement and present prospects of a work destined, at no distant period, to form a main connecting line between the west and the Atlantic, and add largely to the trade and prosperity of the State and city.

All of which is respectfully submitted.

By order of the board.

S. V. MERRICK, *President.*

GEORGE V. BACON, *Treasurer.*

Philadelphia, October 30, 1847.

#### Gauge, or Width of Track for Railroads.

*Report on the Gauge for the St. Lawrence & Atlantic Railroad. By A. C. Morton, Esq., Chief Engineer.*

Continued from page 776.

There is a strong objection on the part of most companies to their cars going a great distance off their road and beyond their immediate control, particularly when their own line is of much extent having branches and a large local trade.

It is stated that the Boston and Worcester and Western railroad companies, whose roads form part of the line between Boston and Buffalo, will not allow their cars to go west of the Hudson river, or to leave their own roads except to pass over the Greenbush and Troy road of six miles in length, for the purpose of receiving the freight transferred to them from the cars of other companies west of Troy.

The inconvenience of exchanging cars are represented, by persons who have had much experience on roads where it takes place, to be very great, and the cost of repairs very considerably increased. Cars furnished by so many different corporations, often differ materially in their construction, their strength, the ease with which they run and the amount of service they will perform without extensive repairs.

They are not subject to that constant and careful inspection, in passing over so many roads and such long continuous journeys.

Small repairs are more apt to be delayed till the defect becomes serious, and consequently the cost of making it good much increased.

Defective cars are often neglected from a desire that they may be returned to the company to whom they belong, for the necessary repairs, and this will often be the cause of serious accidents and at all times of increased expense.

The regulations in regard to the inspection and prompt repair of cars, cannot be too rigidly and strictly carried out, for a little remissness is often the cause of serious results.

With reference to the transfer of freight, there are many strong objections and ordinarily it should not be permitted, but even this will for very long lines under certain circumstances, I believe, be found preferable to an interchange of cars. There are many kinds of freight which may be transferred from one conveyance to another with great despatch and economy.

The article of flour which will constitute a most important article of freight on your road, I am informed on good authority, is transhipped from cars to vessels at Detroit, at the rate of one shilling for 100 bbls. Freight is transhipped at Albany, from canal boats to barges, at the rate of two pence per ton.

At other points in the United States, where a large amount of merchandize is to be transhipped, it is done with great economy by machinery propelled by steam, and it is believed that improvements will be made for the transfer of freight on railroads, that will materially reduce the cost, and render it on

every account far less objectionable than at present.

It is simply a question of cost, and if facilities of transshipment are such as to make the cost and inconveniences no more than the difficulties and expense resulting from an extended interchange of cars, I believe it will be adopted in preference.

Much has been said about the difficulty of transferring cattle and other live stock from one car to another. But every one knows who has had any experience in the business, that with suitable arrangements there is no practical difficulty and necessarily but slight delay.

All that is required in loading cattle in the first instance into cars, is to have a yard parallel with the train of cars, with inclined passage ways leading to, and on a level with the floor of the several cars, through which cattle are readily driven on to the cars. So in transferring cattle from one train to another, it is only necessary that the trains should stand parallel, and opposite each other with an intervening platform, and passage ways provided, through which cattle are as readily driven as they would be through a lane or a narrow street.

The same operation would effect the transfer of all kinds of live stock with equal facility. Live stock is in fact the cheapest of all kinds of freight for transshipment.

The time occupied in doing this with such arrangements as should always be provided, would not be greater than is now often required at stations in loading or unloading freight where no change of cars takes place.

There would be little difficulty in transferring several kinds of freight without breaking bulk either by removing the car bodies, or by the use of boxes, both being effected with steam cranes or other machinery.

In the evidence before the gauge commissioners it is stated by an engineer (not connected with the broad gauge interest) of great experience, not only in the construction of railways, but in the transfer of freight by both the above methods, that "there was no difficulty whatever in doing it." And he further states that, on a large scale "the cost would not exceed half a penny per ton."

On the main line of the Pennsylvania improvements, freight is transhipped in crossing the Allegheny mountains from the canal to the railroad on one side, and from the railroad to the canal on the other side of the mountain, without breaking bulk. A transshipment takes place on the main line of the New York canals at Albany, where over one million of tons arrive annually, and in fact transshipments occur on all the leading routes from the seaboard west.

Wherever a transfer of merchandize is necessary or advisable which will often occur for various reasons in an extensive country, there will always be abundant means to effect it expeditiously and economically.

But in reference to the Passumpsic branch of your road, it is not simply a question of the policy of transferring freight from one gauge to another. There are other circumstances connected with this branch which

have an important bearing. The amount of the freight that will be likely to pass this branch, and the nature of the business generally, enter into the consideration of the subject.

Your road, as stated in another part of this report, is designed to furnish the shortest and best communication with the seaboard; and with a view to avail yourselves of all the natural advantages of your route, to furnish to the public the conveniences and facilities of transportation which the nature and extent of the business to be done require and to enable you to compete successfully with rival routes, you deemed it important to give to your road an enlarged capacity.

Now the question arises whether the connection with this branch, situated, as it is, holds out sufficient inducement in the amount of its business for the attainment of which it would be advisable for you to sacrifice the great and manifest advantages of your main line.

The distance as before stated from Montreal to the seaboard by this branch, and the roads to connect with it, will be about 107 miles longer than by the main line to Portland.

The great number of corporations on this route, over whose roads the business must pass, and the difficulties attending it have also been alluded to, such as the separate management of each road, consisting of the officers, agents and clerks of each company, each furnishing its own power with engine men, firemen, conductors, etc., whether the road is 20 or 120 miles in length.

The terminus on the seaboard is not at the open harbor of Boston, but in the rear of the city where freight destined for a foreign market must be subject to the delay and embarrassment of vessels approaching it through numerous draw bridges and accumulation of ice in winter, or be carted across the city.

These are peculiarities which have a direct tendency to increase the cost of transportation, and should they be found so great as to increase it materially it is a question whether any very large amount of through freight will take this route.

With this great difference in distance and the other disadvantages above mentioned, there can be no doubt that the cost of transporting all descriptions of freight from Montreal to the seaboard by the branch route will be very much greater than by your main line.

As it regards the curvatures and grades of the two routes, if any difference exists, it is but slight, both may be regarded as favorable.

You are aware however that on the Portland line a very large portion of the distance is nearly level or descending towards the seaboard.

There are but two corporations comprising this line, whose charters were granted by the respective governments with a view to their being united as one road, and the sole object of these corporations, through all the incipient stages of the work, and up to the present time has been to consolidate the interests and

render the roads identical. The same system as it regards their location, the plan of construction, the width of track, and the general system of conducting the business of transportation, when these roads shall have been finished, has been mutually agreed upon by the two companies.

The length of road to be built by the two corporations is nearly the same, each being a favorable distance to operate economically, and uniting at the same time at the boundary line between the two countries.

The terminus at the seaboard is at one of the best harbors on the Atlantic coast; it is large and capacious, easy of access and is never closed with ice. The terminus is so located as to be parallel with the main harbor, presenting an uninterrupted wharf of half a mile in extent, along which every class of vessels may be safely moored to discharge their cargoes and to receive directly from the cars their return freight.

These are the leading features of your main line, and they are alluded to not with the view to draw an invidious comparison or a desire to detract in the least from the merits in the least from the merits of the line which is proposed to form a connection with your branch, for I regard it as an important line, and one which will add very considerably to the revenue of your road.

But it is with the view that the subject of transportation of through freight may be more fully understood, and that you may judge more accurately as to the probable route the mass of the business will take, and the bearing this may have on the gauge of your road and your ability to compete other lines, whose object is to turn the trade from the St. Lawrence before it reaches you.

The efforts that are now making to deprive you of the trade to which you are naturally entitled by your position, are such that it not only effects in the greatest degree the interests of the stockholders in your road, but the whole business population of the lower province.

It is a subject of serious consideration with you whether it will be more for the interest of your stockholders and the public at large to adopt a narrow gauge for the sake of uniformity with foreign lines which cannot add to your ability to compete for this trade, or to adhere to one of the great advantages which will give your main line the superiority beyond a question.

Owing to the greatly increased distance and other disadvantages of this branch as contrasted with your main line to Portland, it does not appear likely that a large amount of merchandize forwarded for shipment to England or to a foreign market, will pass over this road.

To illustrate the subject, we will suppose that the distance via this branch is only 370 miles.\* The distance to Portland as now

\*The distance as given in the printed reports of the several companies, together with the distance from the boundary to Montreal gives a total of 387 miles between the latter place and Boston by this route.—This, however, may be hereafter reduced by new lines, and I have assumed above that the distance will be only 370 miles.

surveyed by the longest route, is 280 miles, assuming that an average charge of 14d. per ton per mile is made on freight, the cost of each ton carried to Boston over this branch will be

£1 18 6  
And each ton carried to Portland  
via the main line will be . . . 1 0 2

Giving a difference in cost of . . . £0 9 4  
per ton in favor of the main line, not including truckage or extra expense at Boston in reaching vessels.

The question of transshipment as it regards the mass of freight, has with this view of the subject but little bearing, for it is supposed that generally it would take the cheapest route, and should the advantages of a wider gauge and a less number of corporations lessen the cost of transportation, the above difference in favor of the main line will be still further increased.

It may be thought, by some persons unacquainted with the circumstances, that as Boston exceeds Portland in population and in business, that the advantages of making shipments would be greater there than at the latter port.

When it is recollected, that the State of Maine exceeds any other State in the Union in the number and capacity of her harbors, and in the tons of shipping which she now annually puts afloat, there need be little apprehension about the facilities of making favorable shipments, when your road shall have been extended to that port. And, as before remarked, the advantages of Portland harbor as regards its capacity, safety, and freedom from ice in the winter, its position and accessibility, and the far greater economy with which it is reached from the interior, are such as to give it a decided superiority, as connected with your trade, over any other port of the eastern States.

Adopting a wide track does not cut off your trade from the direction of this branch, for it is shown that there is a transshipment on the main line of roads passing through the State of Massachusetts, and New York, all having the same gauge, and forming the most important line of railway communication in the United States.

The circumstances of these roads are similar to yours in connection with this branch, and the other lines forming its extension to the same point in the State of Massachusetts, and they are such as at present to render a shipment necessary.

Notwithstanding this, a large business has been done; and why should not the business of the Passumpsic branch be done with equally favorable results.

It is alleged, that a large business would be done with Boston, and that the adoption of a wider gauge cuts off the connection with the line leading to that city, and therefore does not allow a choice of markets.

On a full view of the subject, I believe that this conclusion will be sustained, but that the adoption of a wider track for your road will not only allow an equal choice of markets, but lessen the cost of reaching these markets.

To be Continued.

**RAILROAD IRON.—500 TONS OF THE**  
latest and most approved pattern of T Rail—  
weighing about 63 lbs. per yard, shipped from Eng-  
land in October, and shortly expected. For sale by  
**BOORMAN, JOHNSTON & CO.,**  
349 119 Greenwich St., New York.

**DEAN, PACKARD & MILLS,**  
MANUFACTURERS OF ALL KINDS OF

**RAILROAD CARS,**

SUCH AS  
PASSENGER, FREIGHT AND CRANK CARS,

— ALSO —  
SNOW PLOUGHS AND ENGINE TENDERS  
OF VARIOUS KINDS.

CAR WHEELS and AXLES fitted and furnished  
at short notice; also, STEEL SPRINGS  
of various kinds; and

SHAFTING FOR FACTORIES.

The above may be had at order at our Car Factory,  
REUEL DEAN,

ERS OF MARINE AND LOCOMOTIVE  
ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 48 in calibre and 2 to 19 feet long,  
capable of sustaining pressure from 400 to 2300 lbs.  
per square inch, with Stop Cocks, T. L., and  
other fixtures to suit, fitting together with screw  
joints, suitable for STEAM, WATER, GAS, and for  
LOCOMOTIVE and other STEAM BOILER FIRES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
**PHILADELPHIA.**

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now mak-  
ing Railroad Bars, and are prepared to execute or-  
ders for any required pattern. Apply to

**FULLER & BROWN, Agents,**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847. 10c

**CHILLED RAILROAD WHEELS.—THE**  
undersigned are now prepared to manufacture  
their Improved Corrugated Car Wheels, or Wheels  
with any form of Spokes or Disks, by a new process  
which prevents all strain on the metal, such as is  
produced in all other chilled wheels, by the man-  
ner of casting and cooling. By this new method of  
manufacture, the hubs of all kinds of wheels may  
be made whole—that is, without dividing them into  
sections—thus rendering the expense of banding un-  
necessary; and the wheels subjected to this process  
will be much stronger than those of the same size  
and weight, when made in the ordinary way.

**A. WHITNEY & SON,**

Willow St. below 13th,

Nov. 10, 1847. [tf.] Philadelphia, Penna.

**LAP—WELDED  
WROUGHT IRON TUBES**

FOR

**TUBULAR BOILERS,**

FROM 1 1/4 TO 6 INCHES DIAMETER,

and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manu-  
facture as those so extensively used in England,  
Scotland, France and Germany, for Locomotive,  
Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

1y25

28 Platt street, New York.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps  
constantly for sale a very extensive assortment of  
Wrought Spikes and Nails, from 3 to 10 inches,  
manufactured by the subscriber's Patent Machinery,  
which after five years' successful operation, and now  
almost universal use in the United States (as well  
as England, where the subscriber obtained a patent)  
are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes  
having countersink heads suitable to holes in iron  
rails, to any amount and on short notice. Almost  
all the railroads now in progress in the United States  
are fastened with Spikes made at the above named  
factory—for which purpose they are found invaluable,  
as their adhesion is more than double any com-  
mon spikes made by the hammer.

All orders directed to the Agent, Troy, N. York  
will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by J.  
& J. Townsend, Albany, and the principal iron mer-  
chants in Albany and Troy; J. L. Brower, 222 Water  
St., New York; A. M. Jones, Philadelphia; T. Jan-  
viers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward  
their orders as early as practicable, as the subscriber  
is desirous of extending the manufacturing so as to  
keep pace with the daily increasing demand.  
ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Stand-  
ing Ship Rigging, Mines, Cranes, Tillers etc., by  
**JOHN A. ROEBLING, Civil Engineer,**  
Pittsburgh, Pa.

These Ropes are in successful operation on the  
planes of the Portage Railroad in Pennsylvania, on  
the Public Slips, on Ferries and in Mines. The  
first rope run upon Plane No. 3, Portage Railroad,  
has now run 4 seasons, and is still in good condi-  
tion. 92v11y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors  
and Managers are respectfully in-  
vited to examine an improved Spark  
Arrester recently patented by the un-  
dersigned.

Our improved Spark Arresters  
have been extensively used during the  
last year on both passenger & freight  
engines, and have been brought to  
such a state of perfection that no an-  
noyance from sparks or dust from the  
chimney of engines on which they  
are used is experienced.

These Arresters are constructed on  
an entirely different principle from any heretofore offered to the public.  
The form is such that a rotary motion is imparted to the heated air,  
smoke and sparks passing through the chimney, and by the centrif-  
ugal force thus acquired by the sparks and dust they are separated from  
the smoke and steam, and thrown into an outer chamber of the chimney  
through openings near its top, from whence they fall by their own  
gravity to the bottom of this chamber; the smoke and steam passing  
off at the top of the chimney, through a capacious and unobstructed  
passage, thus arresting the sparks without impairing the power of  
the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use  
on the following roads, to the managers and other officers of which we are at liberty to refer those who  
may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintend-  
ant Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and  
Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown  
Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wil-  
mington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.;  
W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensse-  
laer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio  
Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Mo-  
tive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabeth-  
town and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah,  
Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad,  
Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, Presi-  
dent Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whit-  
ney, of this city or to Hinckly & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasona-  
ble terms. Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail  
Works have always on hand, of their own manu-  
facture, a large assortment of Railroad, Ship and Boat  
Spikes, from 2 to 12 inches in length, and of any form  
of head. From the excellence of the material al-  
ways used in their manufacture, and their very gen-  
eral use for railroads and other purposes in this coun-  
try, the manufacturers have no hesitation in warrant-  
ing them fully equal to the best spikes in market,  
both as to quality and appearance. All orders ad-  
dressed to the subscriber at the works, will be prompt-  
ly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of  
Erastus Corning & Co., Albany; Hart & Merritt,  
New York; J. H. Whitney, do.; E. J. Etting, Phila-  
delphia; Wm. E. Coffin & Co., Boston. ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Paterson, N. J. The  
undersigned receive orders for the following articles,  
manufactured by them of the most superior descrip-  
tion in every particular. Their works being exten-  
sive and the number of hands employed being large,  
they are enabled to execute both large and small or-  
ders with promptness and despatch.

**Railroad Work.**

Locomotive steam engines and tenders; Driving  
and other locomotive wheels, axles, springs & flange  
tires; car wheels of cast iron, from a variety of pat-  
terns, and chills; car wheels of cast iron with  
wrought tires; axles of best American refined iron;  
springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery  
of all descriptions and of the most improved patterns,  
style and workmanship.

Mill gearing and Millwright work generally;  
hydraulic and other presses; press screws; callen-  
ders; lathes and tools of all kinds; iron and brass  
castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

## CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

### THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trelis are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trelis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trelis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.			
1,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	686 96	
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,493 ft. b.m., at \$13 =	57 21	
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25	
Workmanship free of patent charge.....		600 00	

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.

Civil Engineer and Patentee.

**LAWRENCE'S ROSENDALE HYDRAULIC Cement.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by JOHN W. LAWRENCE, 142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 ly

**RAILROAD IRON AND LOCOMOTIVE Tyres** imported to order and constantly on hand by A. & G. RALSTON

Mar. 20th 4 South Front St., Philadelphia.

**THE NEWCASTLE MANUFACTURING Company** continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention. ANDREW C. GRAY, 245 President of the Newcastle Manuf. Co.

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom: Iron only. Address

SAM'L KIMBER & CO.,

Willow Street Wharf,

Philadelphia, Pa.

# RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have tried it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.

WIRE ROPES.			HEMPEN ROPES.		CHAINS.		STRENGTH
Wire gauge number.	Circumference of rope.	Weight per fathom.	Circumference of rope.	Weight per fathom.	Weight per fathom.	Diameter of iron.	
	INCH.	LB. OZ.	INCH.	LB. OZ.	LB.	INCH.	Tons.
11	4½	13 5	10	24 -	50	15-16	20
13	3½	9 3	8½	16 -	27	11-16	13½
14	3½	6 11	7½	12 8	17	9-16	10½
15	2½	5 2	6½	9 4	13½	1-8	7½
16	2½	4 3	6	8 8	10½	7-16	7

N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion. 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.  
Factory, 9th street, near Coates, cor. Melon st.  
Office, No. 3 North 5th street,  
Philadelphia, Pa.

1y35

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee  
G. A. NICOLLS,  
Reading, Pa.

ja15

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 30 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

[Signed,]

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

[Signed,] G. A. NICOLL,

Sup't Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

[Signed,]

T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

[Signed,]

JOHN LEACH,

Jamaica November 12, 1845.

## THE SUBSCRIBERS, AGENTS FOR

the sale of

Codorus,

Glendon,

Spring M.I. and

Valley,

} Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846. [1y4]

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 19th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia. 11f

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

New York.

1y10

# NORRIS' LOCOMOTIVE WORKS. BUSHHILL, SCHUYLKILL SIXTH-ST., PHILADELPHIA,

**MANUFACTURE** to order Locomotive Steam Engines of every plan or size. Their shops being enlarged, and their arrangements considerably extended to facilitate the speedy execution of work in this branch, they can offer to Railway Companies unusual advantages for prompt delivery of Machinery of superior workmanship and finish. Connected with the Locomotive business, they are also prepared to furnish, at short notice, Chilled Wheels for Cars of superior quality. Iron and Brass castings, Axles, etc., fitted up complete with Trucks or otherwise.

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,  
12 Platt street, New York.  
JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 28ct

**S**PRING STEEL FOR LOCOMOTIVES, Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**T**HE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,  
Philadelphia.

ROBERT NICHOLS, Agent,  
No. 79 Water St., New York. 26ct

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 28ct

J. BALL & CO.

**K**EARNEY FIRE BRICK. F. W. BRINLEY, Manufacturer, Perth Amboy, N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, mos. from delivery of brick on board. Refer to

**SOUTH CAROLINA RAILROAD.—A**  
 Passenger Train runs daily from Charleston,  
 on the arrival of the boats from  
 Wilmington, N. C., in connection  
 with trains on the Georgia, and Western and Atlantic  
 Railroads—and by stage lines and steamers connects  
 with the Montgomery and West Point, and the  
 Tusculumbia Railroad in N. Alabama.  
 Fare through from Charleston to Montgomery  
 daily ..... \$26 50  
 Fare through from Charleston to Huntsville,  
 Decatur and Tusculumbia..... 22 00  
 The South Carolina Railroad Co. engage to re-  
 ceive merchandize consigned to their order, and to  
 forward the same to any point on their road; and to  
 the different stations on the Georgia and Western  
 and Atlantic railroad; and to Montgomery, Ala., by  
 the West Point and Montgomery Railroad.

JOHN KING, Jr. Agent.

**CENTRAL AND MACON AND WEST-**  
ern Railroads, Ga.—These Roads with the  
Western and Atlantic Railroad  
of the State of Georgia, form a  
continuous line from Savannah to Oothcaloga, Ga.,  
of 371 miles. viz:

**THE WESTERN AND ATLANTIC**  
Railroad.—This Road is now in operation to  
Ootheloga, a distance of 80 miles, and connects  
daily (Sundays excepted) with the Georgia Rail-  
road.

From Kingston, on this road, there is a tri-weekly  
line of stages, which leave on the arrival of the cars  
on Tuesday, Thursday and Saturday, for Warrenton,  
Huntsville, Decatur and Tuscumbia, Alabama,  
and Memphis, Tennessee.

On the same days, the stages leave Ootheloga  
for Chatanooga, Jasper, Murfreesborough, Knoxville  
and Nashville, Tennessee.

This is the most expeditious route from the east to  
any of these places.

On Weight Goods—Sugar, Coffee, Liquor, Bagging, Rope, Butter, Cheese, Tobacco, Leather, Hides, Cotton Yarns, Copper, Tin, Bar & Sheet Iron, Hollow Ware & Castings.....	To Atlanta.	\$0 50
	To Ortocaloga,	\$0 75

Freight may be paid at Savannah, Atlanta or Oothcaloga.  
F. WINTER, Forwarding Agent, C. R. R.

**NEW YORK AND PHILADELPHIA RAIL-**

The lines for Baltimore leave Philadelphia daily except Sundays, at 8 a.m., 3 $\frac{1}{2}$  and 10 p.m., and Saturdays only at 10 p.m.—being a continuation of the

# PHILADELPHIA AND READING RAILROAD.—Passenger Train Arrangement for 1847.

## FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor,  
D. K. MINOR.

## BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

## AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, December 18, 1847.

### A WORD TO ALL.

**Missing Numbers.**—We again remind our subscribers that we shall cheerfully supply missing numbers for the current and past volumes—if we have them to spare—on receiving a list. It is much more easy to supply them now than at any future period.

If we have omitted to comply with any of the applications heretofore made for missing numbers, it has arisen from inability at the time—not from indisposition—it may therefore be worth the labor of furnishing a new list, as we have received many loose numbers of back volumes, from which they may possibly be supplied.

### Warming Railway Cars.

Tappen Townsend, of Albany, N. Y., has patented a mode of warming railroad cars. He says, "what I claim as my invention, and desire to secure by letters patent, is the application to railroad passenger trains, of the combination of the flues, connected by the elastic and flexible hose, with the openings and registers in the bottoms of the cars."

### Improved Method for Ascending and Descending Inclined Planes.

Mr. G. E. Sellers, of Cincinnati, Ohio, has invented a method of ascending and descending inclines, by having a central rail and driving wheel to grip the rail connected with a spring to give them the required adhesion on the rail. He also connects the driving wheels by toggle joint levers whereby the train is made to act upon the gripping wheels, and yet leaves the locomotive free in a measure without any strain, and in the event of the engine breaking the connection with the train, there are arms on each side that are caught by chain or joint

rods to arrest the progress, forwards or backwards of the train in a decent or ascent.

### New York Canals.

It is said that the amount of tolls on the canals of the State of New York this year will reach about \$3,650,000, being an increase of nearly a million of dollars over the tolls of last year—which will leave a large surplus to be applied towards enlarging the Erie canal and completing the Black river and Genesee valley canals.

The amount of tolls collected on the canals since the opening of navigation on the Erie canal in 1820 up to the present time—a period of 28 years—is over thirty-seven and a half millions of dollars.

The increase of business on the canals is shown by a comparison of the tolls received in 1826 (the year after the completion of the Erie and Champlain canals) with those of the present year, viz:

1826—tolls.....	\$762,003
1847—tolls.....	3,650,000

Increase.....\$2,887,997

It must not be forgotten, however, that the rates of toll have been reduced nearly one-half since 1826.

### Manufacture of Iron.

We copy the following description of Mr. Alexander Dickerson's plan of manufacturing malleable iron, from the Scientific American.

"Improvement in apparatus, by Alexander Dickerson, of Newark, N. J., for the manufacture of malleable iron. Patented 13th March, 1847. Re-issued 21st August, 1847. Claim.—What I claim as my invention, and desire to secure by letters patent, is: first, the method of manufacturing malleable or wrought iron direct from the ore, by means of a furnace, combining a chamber containing the charge of ore and fuel, with a closed forged fire below the same and communicating therewith, containing a continuation of the charge and the loup of wrought iron formed therein; said forge fire being provided with a large door for the introduction of a portion of the charge for shutting in and confining the charge, excluding the air therefrom during the process, removing the loup when formed, and clearing out the fire preparatory to another charge. Secondly, the use of moveable bars or slides in combination with the said closed forge fire and chamber, inserted and passing through the charge, to serve as a temporary grating to sustain the upper portion of the charge, or a new charge, while the lower portion is burning down and the loup is taken out."

### Lachine Canal.

The Montreal Herald gives the following account from a correspondent, of the opening of the Lachine canal. The writer says: "To-day, 19th instant"—but we are not certain whether it was in October or November—"the new lock here, called the Guard Lock, was opened for the first time, thus allowing large craft to descend to Montreal. The first craft locked down was a barge, the property of Hilyard & Walker, containing 1673 barrels of flour, besides some butter, etc.; the first locked up were three steamers, viz: the Beagle, Princes Royal and Cata-raqui. This lock, which may be said to be finished, measures 200 feet from gate to gate, 45 feet wide. Passing through the lock, you ascend a channel 120 feet wide and 10 deep; 2700 feet of this channel required excavation, which was principally effected this summer. On the left, as you ascend for about 3900 feet, is the coffer dam, which served to dry the channel till it was excavated, and now retains the water; it is constructed of two lines of cribs, each 12 feet wide, leaving a space of six feet between for a puddle chamber.

"It is partly surrounded by a receding stone wall rising above high water mark, and measuring about 22 feet on top. The rest of the wall is in a forward condition, and when finished will form an agreeable promenade to those living in or visiting Lachine."

### Tire for Railroad Wheels.

The following mode for making tire for railroad wheels has been patented by Messrs. Saunders, Bisset and Saunders. They say that the following is their mode of procedure, viz: "A pile of iron and steel is made as follows—first a large bar of iron, then a thin bar of steel, then another bar of iron, the latter being thin, and serving only as a protection to the steel from being burnt in the process of welding, the whole is then welded. The bar is then passed through a series of rollers giving the required shape to the tire, shrunk on to the wheel, and the thin plate of iron turned off to expose the steel to the surface."

### Iron Ship Ribs.

Mr. Richard F. Loper, of this city, has made an important improvement in ship building, whereby he uses hollow iron ribs, instead of timber, or solid iron ones, and binds them together by wooden planking, thereby combining strength with buoyancy and lightness. The ribs being hollow, he uses them as canals to lubricate the bolts and fastenings by pouring oil through the hollow ribs, thereby preventing the rotting of planks, and oxidation of the metal.

The route for the Cocheco railroad, from Dover, N. H., to the line of the Montreal railroad, at Meredith, 44½ miles, has been surveyed, and found feasible. The total cost of the road, including engines, cars, etc., is estimated at \$1,032,000.

On the Michigan Central railroad, the receipts from September 24th, 1846, to October 31st, 1847, were \$534,205. The increase in the month of October, as compared with last year is equal to 33 per cent.

The receipts on the Georgia railroad for October, are said to have exceeded those of last year by \$1,889.

On the Mad River and Lake Erie railroad, \$38,120 were received from passengers in the year ending October 16th, and \$70,667 from freight. The length of the road is 134½ miles, of which 102 are in operation. We understand that within a short time 12,000 shares of company stock have been disposed of in the Boston market, the proceeds of which will enable the company to prosecute the work to completion without any further delay. The contracts for completing this road to Springfield have all been let—the work to be completed by the 1st of May, 1848.

We learn from the Eaton Register, that sufficient stock has been subscribed in the Eaton and Hamilton railroad to enable the corporators to organize, and proceed with their business. The distance from Eaton to Hamilton is 26 miles.

The Cincinnati Gazette observes that "these Preble county people will put the Cincinnati and Hamilton directors in the shade, if they do not soon bestir themselves to obtain the right of way, and place their line under contract."

The citizens of Montgomery, Ia., are making an effort to have a railroad constructed from Crawfordsville to intersect the Indianapolis and Lafayette railroad at Thorntown or Lebanon.

We learn from the Crawfordsville People's Press that a railroad meeting was held in that place on the 23d ult., Hon. Isaac Naylor in the chair, and T. W. Fry secretary. The meeting was severally addressed by S. C. Wilson, T. W. Fry and W. Bausman; and a committee, consisting of one person from each township, was appointed, with power to appoint aids, to visit different portions of the county and obtain subscriptions.

The great increase on the Little Miami railroad

has rendered a double track a matter of necessity; and the work will be commenced immediately.—About twelve hundred tons of iron have already arrived.

There has been a final decision upon the location of the road from Columbus—Xenia being the terminus and not Springfield. The Little Miami railroad company make the road out of Greene county about 16 miles. The road from Columbus to London will be placed immediately under contract, and the whole line pushed, as far as practicable, so as to have it completed at the earliest possible date. The Cleveland people are making active exertions to finish their link to Columbus, and thus Cincinnati has a good prospect of having two lines of railroads completed to the lake in two years—one terminating at Sandusky, the other at Cleveland. As the Mad river road will be finished early next season to Springfield, that will have the start.

The Connecticut river railroad company are engaged in surveying a route for a branch road to Amherst. The Northampton Gazette says that the survey on one line has been completed, and the distance found to be six and a half miles. The route is a very feasible one, being nearly level.

Engineers are also engaged in surveying a route for a railroad from the line of the Boston, Concord and Montreal railroad, near Union bridge, through Upper Gilmanton, over the "hollow route," London, Pembroke, etc., to Manchester.

Thus we perceive that the people of New England are alive to the importance of the early extension of the railroad system.

**Gravelled Roads.**

The Coburg, Canada, Star, says that "about two years ago the Hon. Z. Burnham persuaded the authorities to grant permission to the path-masters of this township to commute the statute labor, i. e., to take money instead of work, and lay it out on the roads as they deemed most advisable. In consequence, several patches of road were gravelled three inches deep and sixteen feet wide, for 5s. a rod! and those who had occasion to travel over them three months after they were made, will bear us out in stating that finer pieces of road could not be made. Last Fall and Spring they were excellent, while other parts of the road were almost impassable.—Young Mr. Hare, and Mr. John Clark, of Haldimand, had, some time previous to the permission to commute statute labor, by their praiseworthy exertions, managed to get that portion of road between Kelly's and Hammond's hill, gravelled about four inches in depth. Since that period it has been as smooth as a bowling green.

"As to the assertion that 'gravel roads are not fit to use under a twelvemonth from the time of formation,' we would direct the attention of the public to the piece between Burnet's corner and Perry's mills, made only a month ago, now almost perfectly smooth. As to the expense, it cost about 9s. a rod to gravel nine inches deep.

"To render gravel roads fit for immediate use, it is only necessary to throw about an inch of earth (sand loam is best) on the top of the gravel.

"It is only fair to state, that before we were convinced by experience of the superiority of gravel over plank, we were very much prejudiced in favor of the latter."

If we are not mistaken, it requires constant attention to the surface of gravelled roads to keep them smooth, and to prevent the formation of ruts or channels by the wheels; whereas, plank roads, properly made, require very little repair for a long time, and heavier loads may be taken over them.

**The Mining and Railroad Interests.**

It has been feared by many that the railroad interest is progressing more rapidly than the means of the country—indeed of the world—will warrant.—The question has been often asked, "where is the capital to be obtained to complete these works?" It may we think safely be answered—though we have not yet seen the response—that the increased produce of the mines at the present day, over those of twenty-five years ago, is more than sufficient to cover the cost of all the railroads now in use, or in course of construction. If this be so—and we have not a doubt of it—we may look for a vast and continued extension of both these interests, as the facilities afforded by railroads will ensure a constantly increased extension of the mining, as well as of the agricultural and commercial interests of the country, and these in turn re-act upon, and cause an extension of the railroad interest.

We are led to these remarks by an article in the London Mining Journal of 16th October, entitled, "The Silver and Gold Mines of the New World—or the future prospects of the mines of America compared with those of Europe."

We have frequently noticed these articles in that able Journal, and have concluded to re-publish some of them, by way of keeping pace with the progress of the age, in this important department of the industry and wealth of the world.

The writer says:

"If, instead of taking the total production, we take the annual extraction, the Russian Empire will appear in a much more advantageous position. At present, to speak only of gold: suppose the American production to be represented by 100, that of Russia is 144. As the washings of Asiatic Russia are extending incessantly, and as the field in which they take place seems infinite, we are still far distant from the amount which will be obtained. We must expect that shortly, through Russia, the general production of gold will approach the treble of what appeared at the end of the last century on the market of the world. This increase of the extraction must, after a certain delay, bring about a decline in price, because, unless there be a rapid development of wealth among the populations of countries, the means of employing this mass of gold would soon cease to be found, and the offer would thus exceed the demand. In other terms, in supposing that silver should remain at the same point with respect to corn, gold would not be worth more than 15, or 14 or 12 times its weight in silver. The relative value of the two precious metals (I do not speak of the absolute value, nor of the value in relation to that of objects of the first necessity,) would approach what it was among ancient nations, or before the discovery of America. In another point of view, the decline in the venal value of gold could not sustain itself, except in so far as the cost of production should have diminished, for otherwise the production would stop; but when we think on the surprising progress which the mechanical arts make every day, we cannot doubt that the selling price of gold will undergo a reduction, provided the deposits remain the same. Thus the decline, if it should take place, would not be likely to lessen the extraction. Moreover, some time must needs elapse before a production of gold, even triple

that of the commencement of the century, will cause an important reduction in the current price of that metal.

The quantity of gold which exists among civilised nations is so great, that an annual addition of 40,000 kilogrammes, beyond what was ordinarily disposed of previous to 1823, would not rapidly augment the mass in a very sensible manner, and would not affect the value until after a certain delay. This is proved by the fact, that when, 25 years ago, England obtained a sum of more than 1,000,000,000*f*, representing 300,000 kil. of pure gold, in order to coin gold money to replace bank notes, which alone had been in circulation since 1797, the price of gold was not sensibly affected in commerce. And then civilisation is in the vein for peace, which it may be believed that the senseless verbiage of retrograde passions will not induce it to abandon. By peace, easy circumstances and cultivation gain ground among the people—a little elegance and luxury introduces itself among all ranks of society. That is sufficient to secure an easy investment for a production of gold more considerable than that of the present day, without its being necessary for the extractors to occupy themselves with the decline in the value of gold. Before every person in Europe, male and female, shall have a gold watch, gold ring or a gold cross, Siberia has sufficient margin left it—And why, with the aid of peace, should we not come to that?

Nor must we expect that gold will sustain a decline in value comparable to that which may be foreseen, with respect to silver, for a period still uncertain, unless some new El Dorado shall be discovered, in which the conditions of working shall be completely changed. The extraction of this metal does not afford ground for the same extensive improvements as the extraction of silver, which is barbarous in America, the principal centres of production. In this point of view, England, whose metallic specie is in gold, is not exposed to the same loss as France, whose real money is only in silver.

**Production of Silver in Spain.**—On the old continent, Russia is not the only state which has increased its production of precious metals. The progress has been almost general among such of the European states as possess them. The success which Russia has obtained has been striking, incomparable. Nevertheless, it will be seen that some other nations have also made progress worthy of being cited. At the commencement of the century, Europe, without counting Russia, (which we here take in its whole extent, both to the east and west of the Oural mountains) yielded, in pure metal, 1300 kilogrammes of gold, and 52,670 kilogrammes of silver. In 1835 the quantity of gold was about the same, but the production of silver was increased by about 15,000 kilogrammes. The production of gold and silver in Europe was, in 1835, as at the commencement of the century, concentrated in Germany, and in the lower part or the valley of the Danube—that is, to speak more precisely, in the Hartz mountains, in Hanover, in those of Erzgebirge, which are

divided among Saxony, Bohemia, and Prussia, in Hungary and Transylvania—the last two countries, let us repeat, having pretty nearly the monopoly of gold. Out of Germany, and the valley of the Danube, there was not produced, in 1835, more than 10,000 kilogrammes of silver, of a value of about 2,000,000*f*, and from 20,000 to 25,000 kilogrammes of gold. Industry, which, since 1835, has taken a great extension in Europe, has paid more attention to the precious metals than it had previously done. At present, only little is wanting to make the production of silver double what it was in 1835. The principal cause of this development is, that Spain, which possesses important silver mines, formerly very celebrated, has again begun to work them.

The mines of gold, and particularly of silver, in Spain, have enjoyed great celebrity. Sirbo, whose exactitude is better appreciated every day, states the fecundity of them.—Long before him, the prophet Ezekiel had signalized it in his threatening prophecies against Tyre. The deposits of silver in the peninsula were worked with success under the Moors, as under the Romans. Since the country has had more liberty, the working has been resumed, and, at the same time, the numerous beds of coal, with inexhaustible mines of iron, which nature has placed in the Asturias, close to the sea, have begun to be worked with vigor.

The mines of lead, containing silver, situated in the kingdoms of Murcia and Granada, at a short distance from the Mediterranean, are those which formerly yielded, and still yield, a great quantity of silver. The lead, however, is not always associated with silver. The mines of Sierra de Gador, situated behind Almeria, which have yielded as much as 39,000,000 kilogrammes of lead, and still yield from 13,000,000 to 14,000,000 kilogrammes do not contain silver; but the mines which are behind Carthagenia, particularly at Almazarron, and still more particularly those that are worked in a little vale, called the Baranco Jaroso, in the Sierra Almagrera in the kingdom of Granada, have a yield of silver very remarkable, being 1 per 100 with respect to the lead. Having been successively visited by several very intelligent French engineers, the mines of the south of Spain were, in 1845, worked anew by M. Pernolet director of the mines of Pouliaouen, in Brittany. According to this gentleman, the single mines of the Sierra Almagrera yield at present, at least 40,000 kilogrammes of silver, and consequently the total extraction of the whole peninsula cannot be estimated at fewer than 50,000 kilogrammes.

As to gold, the yield of the peninsula is quite insignificant. It may, however, be considered probable that the extraordinary success of the washings of gold in Asiatic Russia will cause searches to be made for that metal in all the countries in which that was formerly done. Success exercises a fascinating power on the heart of man. The example of success sometimes gives rise to the most extravagant enterprises; and, for a stronger reason, it warrants attempts which

possess tolerable chances of success. There would be nothing unreasonable henceforth in attacking, with the means which science indicates, and which Russia every day improves, the alluvions which were formerly renowned for the gold which they contained. They exist some, not only in the Iberian peninsula but also in France, at the foot of the Pyrenees, which formerly made a good yield, especially in the valley of the Ariège, in which the characteristic circumstances of the deposit of gold in Siberia appear to exist. Ireland is also quoted."

Assuming the opinion of the writer to be correct, in relation to the increase of gold and silver, there will not be a lack of means to increase and extend the railroad interest.

#### Baltimore and Ohio Railroad.

##### Superintendent's Report.

We recently published the annual report of the President of this company—and now we commence that of the Engineer and General Superintendent, B. H. Latrobe, Esq.

At the close of the last fiscal year of this company, some changes were introduced in its management, and this is the first report of the General Superintendent. It goes much into detail, and will be found both interesting and useful; therefore we shall give the whole of it, except, perhaps, some of the tables.

OFFICE OF CHIEF ENG. AND GEN. Supt. }

Baltimore and Ohio Railroad. }

Baltimore, October 1, 1847. }

Hon. LOUIS McLANE, President, etc.

SIR:—The following statements descriptive of the operations of this company in the several branches of the service, during the official year ending yesterday, are respectfully submitted as the first annual report of the undersigned, acting as General Superintendent under the new organization established since the last annual meeting of the stockholders. The subjects to be presented will be arranged under these heads:

I. The working of the line east of Cumberland—which will be subdivided into,  
1st. The maintenance of the road and its appurtenances.

2d. The maintenance of the machinery.

3d. The conduct of the transportation.

4th. The revenue expenditures and trade.

II. The reconstruction and improvement of the old road—under the heads of,

1st. The laying of the new track.

2d. The alterations in the location of the road bed.

III. The extension of the road.

1st. West of Cumberland.

2d. East of Mount Clare.

In treating of the first of these divisions, reference will be had to the operations of former years upon this road, and also to those of other lines elsewhere, in order that such comparisons may be made as will enable the proprietors of the enterprise to judge of the manner in which its affairs have been administered.

Before proceeding with the details which follow, it will be proper briefly to advert to the change in the organization of the service above referred to, and which embraced every branch thereof, with the view of making it

commensurate with the increased extent and complication of the business of the road.

The new system went into operation upon the first of May last in all its provisions but that which relates to the mode of keeping the accounts of the tonnage department, which it has been necessary to postpone, until the necessary facilities at the several stations for accurately weighing every article offered for transportation, should be provided, which will now shortly be done.

When this improved organization, with its better distribution of duties and subordination of authority and its more perfect checks in the collection and disbursements of the revenue, shall have been sufficiently long in operation to familiarise all the officers and agents with its details, and when all the requisite additional conveniences for the transaction of the business of the road shall have been completed, it is not doubted that a considerable advance in the general economy of the work will be realised.

The out door working of the road is now in charge of a general superintendent, with three subordinate departments, of road, machinery and transportation, while the in-door financial and accounting branch of the service is administered by a secretary and treasurer, the whole operations and earnings of the road being recorded and preserved in the most concentrated and convenient form, at the company's principal office in Baltimore, —the whole transactions, both out and in-door, being under the eye and control of the president and board.

I proceed now to present an account of the operations which are under the direction of the general superintendent, and of their results, as shewn in the receipts, expenditures and net income of the line, together with such statements as are proper, respecting the manner of disposing of such part of the latter as has been re-invested in the work, and thus converted from income into capital.

#### 1. OF THE WORKING OF THE ROAD.

Taking its divisions in the order already given; and speaking separately of the main stem and Washington branch, and of the former first:

##### *The Main Stem.*

1st. *The Maintenance of the Road.*—Embracing the repairs and renewals.

1st. The road-bed and railway tracks. 2d. The bridges. 3d. The depot buildings. 4th. The water stations.

The expense of watching wooden bridges and pumping water at the stations not supplied by the natural flow of the stream, are separately exhibited in the account of expenditures, and will be noticed under their appropriate heads.

##### 1. *The Road Bed and Railway Tracks.*—

The bed of the road, which for some time after the completion of the graduation is always a source of expense in the removal of washes and slides, and the raising of embankments, is now, after the lapse of 17 years, for the section east of Harper's Ferry, and about six years for the section west of that point, in a well consolidated state. The culverts and drains have had their capacity well

tested by floods, and most of them have been found to pass the water well. Nevertheless, several, even upon the older part of the road, have proved too small, and, in consequence of damage received from the frequent high water of the past year, three large culverts between the Point of Rocks and Harper's Ferry, constructed (and in a very imperfect manner) in 1834, have required to be rebuilt. It is believed that there are but few culverts now left upon the line which will need a similar re-construction, and that this item will hereafter be a light one in the expense account. In reference to the bed of the road, generally, it is gratifying to know that it is ready, without further expense, to receive a second track, whenever the traffic shall be so increased as to require it; which cannot be said of all the railroads in the country, some of which, and among them one of such importance as the Western railroad of Massachusetts, were graded, originally, for but a single track for most of their length, and have still before them the outlay required to widen them throughout for a second.

*The Railway Tracks.*—Upon the main stem, there were, at the commencement of the present year, (Oct. 1st, 1846,) as follows: Plate rail track, east of Harper's Ferry, laid in 1830–34, 87 miles.

H rail track, east of Harper's Ferry, laid in 1838, 19 miles.

Ω rail track, west of Harper's Ferry, laid in 1841–42, 97 miles.

Ω rail track, east of Harper's Ferry, laid in 1846, 5 miles.

Total number of miles, in main and second tracks, inclusive of lateral and double track, east of the Monocacy, and exclusive of sidings, 208 miles.

There have been laid, east of Harper's Ferry, since the 1st of October, 1846, 25 miles of Ω rail track, in completion of the 30 miles of that track authorized last year; and about 11 miles of the same description of track have been brought into use since the 1st of June last, in the prosecution of the re-construction of the 31 miles authorised this year, so that the account stands thus, at this date, October 1st, 1847:

Plate rail track, east of Harper's Ferry, laid in 1830–31, 51 miles.

H rail track, east of Harper's Ferry, laid in 1838, 19 miles.

Ω rail track, west of Harper's Ferry, laid in 1841–42, 97 miles.

Ω rail track, east of Harper's Ferry, laid in 1846–47, 41 miles.

Total number of miles as before, 208.

So that, during the year just expired, the number of miles of plate rail track has been reduced 30, and that of Ω rail track increased a corresponding number. When the whole of the 31 miles of the latter track, now being laid, shall be put down, which is expected early in the coming year, there will be but 31 miles of the old flat-bar road remaining, inclusive of the two miles of main track in the city of Baltimore, and the three miles of the lateral track to Frederick.

The cost of the current repairs of the track thus composed of these different kinds of

structure, has been, for the twelve months, ending September 30th, as follows: The number of miles of each kind is the average kept up through the year; the Ω rail east of Harper's Ferry increases in extent just as the plate rail decreases. In the column of "cost per mile," the upper figures set opposite each description of track show the cost, inclusive of that of keeping the bed of the road in order, which would be the same for any track; and the lower figures show the cost of maintaining the track alone, exclusive of that of the road bed.

*Apportionment of the Cost of Repairs of Railway among the different descriptions of Track upon the Baltimore and Ohio Railroad, during the year ending September 30th, 1847.*

Description of TRACK.	No. of Miles.	Cost of Labor.	Cost of Lumber.	Cost of Iron Bars.	Cost of Castings.	Cost of Bolts and Spikes.	Miscellaneous.	Deduction for old materials sold and 47½% on hand.	Average cost per mile.	Total Cost.
Plate Rail, . . . . .	65	\$27,391 68	\$18,865 98	\$13,929 55	\$960 14	\$4,375 76	\$1,614 17	\$3,371 65	968 876	\$62,956 63
H Rail, . . . . .	19	5,606 04	1,704 84		480 00	534 00	599 67	1,214 00	406 292	7,710 55
Ω Rail east of H. Ferry, . . . . .	97	8,531 16	174 06		200 00	156 16	495 00	1,725 00	290 198	7,831 38
Ω Rail west of H. Ferry, . . . . .	97	22,375 18	29,095 04		1,446 65	1,411 30	2,906 79	6,980 00	498 446	49,252 96
Totals,	208	\$79,904 06	\$41,820 92	\$13,929 55	\$3,084 79	\$6,378 22	\$5,615 63	\$13,290 65	614 533	\$127,751 52

This division of the expenses among the different sorts of track is not precise; but it is sufficiently exact to show pretty correctly the relative expense of maintaining them during the year—From this comparison it may be inferred, that if the the whole 87 miles of plate rail track with which the year was commenced had been continued throughout it, instead of having an average of 27 miles of it supplanted by the new Ω rail track, the expense of repairs would have been \$18,306 greater than they were, and that if the new track had wholly superseded the old, the saving would have been \$44,070. The cost

of the repairs of the track during the preceding year, ending September 30th, 1846, were \$115,566 46, after deducting \$579,03 for increase of the value of the stock of materials accumulated during the year. The expense of repairs is therefore greater this year than the last, by \$12,185 06, notwithstanding the assistance derived from the new track east of Harper's Ferry.

This is to be accounted for in two ways: 1st. The more extensive renewal of perishable material. 2d. The increased wear and tear from increased trade.

Under the first of these heads it is to be observed that in all tracks, into the construction of which wood enters, decay has its regular periods, the intermissions of which correspond to the time for which the material will endure exposure to the weather and other agents of destruction. This period with the sort of timber generally used in railways, is from six to eight years. Where it is put perfectly green into the track, as was the case with the road west of Harper's Ferry, it is shorter. The past year, for that part of the road, has been the sixth, and the present will be the seventh year of duration, and these will have been the years of greatest expense in its renewal, and by the end of the eighth year, terminating October 1st, 1849, the whole wooden part of that section, 97 miles in length, will have been renewed. The periods of decay and renovation will not however come round so regularly hereafter; as much of the timber put into the track in 1841 and '42 was of inferior quality, from the impracticability of procuring better, in the haste of first construction. This timber began to decay after it had been but three years in the track, and thus the process of renewal was commenced before the arrival of the regular period appropriate to the sort of lumber used upon other sections of the road and to be used hereafter. This will lead to a more uniform distribution of renewals for the future, and by procuring and storing as it is proposed, the required lumber during the year preceding its use, the length of its duration will be materially extended. The 19 miles of H rail track, laid in 1838, are now, also, requiring large renewals of the cross ties and sills upon which it is laid, and which have been of a description of wood more durable than that used west of Harper's Ferry, has lasted longer.

The durability of the longitudinal pieces of timber has thus far appeared to be about equal to that of the cross ties.

Under the second head of wear and tear, the reason of the increased cost of repairs is still more remarkably manifest, the trade of the road during the past year being more than fifty per cent. greater than that of the one preceding it. These two causes would suffice to account for a much larger increase than has actually taken place, as will be apparent upon comparing the cost of maintenance road per ton and per passenger per mile, in the tabular statement appended to this report, for which 1846 was 248 1000 cents and 603 1000 of a cent, and in 1847, 181 1000 cents, and 422 1000 cents respectively—a re-

duction of twenty-seven per cent. upon the former, and thirty per cent. upon the latter, in favor of the year just expired.

#### THE BRIDGES.

This head of expenditure has shown a large and important one for the last three years—principally on account of the necessity of rebuilding most of the many wooden viaducts upon the line. Of these numerous and extensive structures, the aggregate length is 4115 feet, in spans varying from 40 to 150 feet, besides 1633 feet of trestle bridging at Harper's Ferry, making the whole length of timber bridging 5748 feet, or 1.09 miles.—They carry the road across eleven large rivers and three smaller streams intersected by the route.

They were built originally with a view to much lighter locomotives and trains than those since traversing the road. They were also built of materials, the best to be had at the time, but not offering the choice in quality which is now open, and put into the work with but little seasoning. Decay consequently soon commenced while the increasing weight and frequency of the trains imposed a duty which required increasing instead of diminishing ability to perform. The result has been that, although some of these viaducts have suffered much more than others, yet that an entire reconstruction of the whole has been considered expedient rather than a resort to a less thorough renovation, which would have been less safe, and in the end more expensive. In this, no pains and expense have been spared to render them capable of performing the severest duty that can ever be required of them, and entire success has been the result. All the new work has stood the tests of its strength completely—and the most difficult and extensive structure of the whole, the wide arch at Harper's Ferry has now borne the trade of the road under the most trying circumstances for two years without exhibiting the smallest weakness in any of its parts. A very important part of the improvements applied to the new structures consists in covering them from the weather and providing for the seasoning of the timber more perfectly than before, and their protection, it is believed is now so effectual as to secure them against all the usual causes of decay, and to render them as durable as if built of stone or iron. The agent of destruction remaining to be guarded against is fire, and this danger can only be averted by a vigilant watch, the employment of which will always be indispensable, but the expense of which will not increase with the trade of the road and will thus be a diminishing tax upon it.

In dividing the whole cost of the bridge account, under the heads of "improvements" and "current repairs," I have been guided by the experience of the first two years of their duration, after the opening of the road from Harper's Ferry to Cumberland in 1842, during which period they cost, in 1843, \$6,455, and in 1844 \$6,248, making an average of \$6,351 to maintain them in repair. This is about one-ninth or eleven per cent. of what they have cost per annum to rebuild them in

the three subsequent years, and I am satisfied that with their new and vastly superior structure, they may be kept in perpetual repair, under any future increase of trade, for what it cost—say \$6,351 per annum to maintain them under the light traffic of the two first years of their existence—in 1843 and 1844.

The whole cost of maintaining and rebuilding bridges in the year ending September 30th, 1847—was \$65,363 74. From this we deduct \$5,105 79 for the cost of rebuilding culverts, destroyed by floods, and for other masonry, and there will be left \$60,257 95 for wood and all other work. From this there must be taken \$7,819 29, on account of the increase of materials on hand, compared with the stock reported September 30th, 1846—and there is left \$52,438 66, as the entire outlay for work done upon wooden viaducts this year. Estimating, as above, the sum of \$6,431 for ordinary annual repairs, and deducting it from the whole expense of the work, there remains \$46,087 66, as the cost of permanent improvements properly chargeable to capital and considered as an investment in the work.

Before leaving this subject it is right to state that the experience of all other roads of heavy trade in the United States is in regard to their wooden bridges, the same. They were built too slightly in the first place, and have required to be reconstructed or strengthened in such a way as to amount to reconstruction—and I may add that all the experience of those companies, as well as that of this, has gone to demonstrate the soundness of the principles upon which the bridges of the Baltimore and Ohio railroad are built.

3d. *Depot Buildings.*—This department of the company's works exhibit much variety in style and material, some of the buildings being very substantial, commodious, and well looking, while others are equally remarkable for the cheap and perishable way in which they were put up. The two principal engine houses and most of the work shops at the Mount Clare depot, together with the car-house there—the depot houses at Ellicott's Mills, Frederick, Harper's Ferry and Baltimore are of the former character,—while the engine houses at Harper's Ferry and Cumberland, and the tonnage and passenger houses at the latter point are the frame structures hastily erected at and soon after the opening of the road in 1842, when the means of the company were for the time exhausted. The maintenance of these slight buildings is, of course, costly in proportion to their deficiency in the qualities of durable work, and the cost of repairs must be expected to be heavy so long as there is so much that is frail in their composition. The total expenditure under this head during the year just closed is \$16,522 72, and after adding \$226 54, for the diminished value of materials in store for future work, amounts to \$16,598 26—being \$6,006 55 greater than during the year 1846. This sum was expended chiefly in the early part of the year, in the considerable alterations and additions made to the buildings on Pratt street, including a complete new set of

scales of enlarged size and improved pattern for weighing merchandise, to replace the old and inferior scales, which had been in service many years. I would also observe that upon examining this account I perceive that much of the work which has been charged to it, would more appropriately have fallen under the head of "improvements" than "repairs," as it was in fact entirely new and additional in its character, and has added permanently to the company's property.

**Watching Bridges.**—The cost of this attendant upon the timber viaducts was \$7,049 65 for the past year—exceeding that of the year previous by \$370 15—due to the employment of an additional watchman for the night, upon the Harper's Ferry viaduct, made necessary by the running of the night trains through this bridge (which is the only bridge with gates upon the line, and upon which tolls are collected.) It will not be practicable to diminish this expense while the bridges are of a combustible material; but on the other hand it is an expense not subject to increase with the trade.

**4th. Water Stations.**—There are thirty-one water stations upon the main stem of the road, including that at Baltimore, and they are well built and durable. Eighteen of them are supplied by pipes conducting the water from springs, and at thirteen the water is pumped by hand or horse power. The cost of maintaining the former is very moderate—that of keeping up the latter is more considerable—the two together amount to \$2,890 08 for the year, being \$770 32 more than those of the previous year—chiefly due to permanent improvements in the pumps and other fixtures of the stations.

**Pumping Water.**—The expense of this operation for the last year has been \$3,061 68 being but \$165 37 greater than the year before, notwithstanding the greatly increased consumption of water. This is an expended but little dependent on the quantity of water used at each station, as the hire of the labor must be paid, whether in full or partial occupation.

#### THE WASHINGTON BRANCH.

**Maintenance of Road.**—In speaking of this head of expenditure upon the branch of Washington, it is not necessary to go into the details just stated in regard to the main stem.

**1st. The Road Bed** of the branch is in good condition, annually improving as the deep cuts become less subject to slides and washes.

**2d. The Railway Track** is also in good order, and the part of it originally laid upon logs, and inferior to the rest in its structure, is now nearly removed. The repairs under these two heads, (after deducting \$22 48 for increase in stock of materials on hand,) have cost \$18,077 88, being \$31 93 more than those of 1846.

**3d. The Bridges** are all of stone, and have been a source of no expense during the year. A square culvert, near the Laurel Factory, which was swept away by a severe flood, has been replaced by a stone arch, with greatly increased water way. The past year's expenditure, under this head, has been

\$1,908 48, and is \$145 27 greater than that of the preceding year.\*

**4th. Depots.**—The only buildings belonging to the Washington branch are those in the city of Washington. The tonnage house is a substantial building and sufficient for the present business. The engine house, though sufficiently well built, is however too small, and the passenger house very deficient in suitable accommodation for so important a station. It has, however, been much improved by some recent alterations in its arrangement, executed while the building was undergoing some necessary repairs. The repairs of depots this year have been \$951 46; being \$23 56 less than those of 1846.

**5th. Water Stations.**—There are six water houses on this road, of which, four are supplied from springs, and two by pumps. Of the former, two have been long since rendered useless by the failure of the sources of supply; but they are not needed in the working of the road. The pump houses are also used only occasionally, and in case of failure of the others. Repairs in 1847, \$413 39, being \$257 54 greater than in 1846.

#### SUMMARY.

The whole cost of maintaining the road bed and railway, bridges, depots, and water stations, including pumping water and watching bridges during the year, ending September 30th, 1847, upon the main stem, has been.....

\$226,374 22

As charged upon the books, but from which must be deducted the increase in the value of the stock of materials on hand, accruing during the year, and amounting to.....

11,327 58

Leaving the true cost of maintaining the road and buildings.....

\$215,046 64

Which is \$18,305 14 more than that of the previous year; and upon the Washington branch the maintenance of the same department has been at a cost of.....

\$21,383 69

Reduced by the sum expressing the increased value of materials.....

22 48

And showing the actual expense of maintenance to have been.....

\$21,361 21

Which is \$411 18 greater than that of the preceding year. The increase, in both cases, will be seen to be not out of proportion to the increased service rendered to the public and the profits of the trade.

**2d. Maintenance of the Machinery.**—This department divides itself into four heads; 1st, locomotives, engines and tenders; 2d passenger cars; 3d, burden cars; 4th, stationary, machinery and shops.

**1. Locomotives and Tenders.**—The whole number of engines belonging to the company

\* NOTE.—Since writing the above, a freshet has occurred, (on the 7th of October) which has destroyed two of the bridges, the Little Patuxent and North West Branch viaduct; and also carried away the new arched culvert near the Laurel Factory, and several other culverts. This casualty will be suitably noticed in the next annual report, as belonging to the current year. The inundation was the highest upon record since the settlement of the country, in the streams crossed by these structures, and the damage to other public works has been extensive. The main stem of this road, however, suffered but little, the injury being chiefly confined to the Patterson bridge, 13 miles from Baltimore, one of the piers of which was injured, but without interrupting the use of the bridge.

is, at this date, 49; divided into four classes, according to their weight and power—there are of the

Class	tons	wheels	rated at	class
1st, weighing 23, on 8, all drivers, 13,	23	8	13	39 of the 4th
2d, weighing 16½ on 8 and 6, do. 2,	16½	8 and 6	2	4 of the 4th
3d, weighing 15, on 8, all drivers, 12,	15	8	12	18 of the 4th
4th, do. 10, on 6 & 8, 2 & 4 do. 22,	10	6 & 8	2 & 4	22 of the 4th

Total,.....49 83

Of the first class, 12 were built by Ross Winans, and one in the company's shop at Mount Clare—of the second, one was built by M. W. Baldwin, and the other rebuilt in the company's shop, from a lighter engine constructed by Eastwick & Harrison—of the third class, four were built by Eastwick & Harrison, three by the New Castle Manufacturing Company, (one of them since rebuilt in the company's shop,) four by Ross Winans, (two of them with upright boilers and horizontal cylinders,) and one by Wm. Norris—of the fourth class, 13 are of the old upright boiler and cylinder patterns, built by Davis & Winans, prior to 1837, and nine are of the manufacture of William Norris. These engines, various as they are in weight and form, are all useful machines in their several degrees. Those of the first class burn Cumberland coal, for which their furnaces are specially adapted; and so do the upright boiler engines of the third and fourth class. The rest burn wood, or a mixture of wood and coal. The passenger trains on both roads were originally drawn by the horizontal six-wheel engines of the fourth class, for which they became too heavy two or three years since, and now eight-wheeled engines of the third class are chiefly used for them; and upon the main stem even these are so often inadequate to the duty that the alternative, will soon be presented, of running more frequent trains, or of using heavier engines, or assistant power, upon the higher grades. Of the third class engines, eight are of a make suitable for passenger trains; six of these ply upon the main stem, three with passengers, constantly, and three ordinarily with freight; the remaining two are regularly employed in the two principal passenger trains upon the Washington branch.

Of the freight engines of the several classes, the whole number are at work upon the main stem, excepting three of the fourth class used on the Washington branch; one of these last is attached to the morning mail train, to Washington, and returns with a load of freight and passengers.

There are thus at work upon the main stem, forty-four engines of all classes, and upon the Washington branch, five, making up the number of forty-nine, as above stated, and equivalent, in their power and performance, to 53 of the fourth or lightest class, first used upon the road. I have considered it useful to make the preceding statement of the company's motive power establishment, not only that its present extent may be fully exhibited, but that its progress, from the lighter to the heavier locomotives, for its passenger as well as freight business, may be observed, with a corresponding advance in the economy of transportation consequent thereupon, as will be shown.

## PERFORMANCE IN MILES RUN.

The duty performed by these engines has been as follows in miles run on the *main stem*:

13 first class engines, with freight trains,	307,586
2 second class engines, with freight trains,	24,702
10 third class engines, with freight trains,	115,885
third class engines, with passenger trains,	129,838
19 fourth class engines, with freight trains,	312,934
The same engines, with passenger trains,	17,031

44 engines of all classes, with passengers and freight, have run.....808,026  
On the *Washington branch*:

2 third class engines, with passenger trains,	44,784
3 fourth class engines, with passenger trains,	15,925
The same engines, with freight trains,	40,652

5 engines of both classes, with passengers and freight, have run.....101,361

49 engines of both classes, with passengers and freight, have run.....909,387

The whole stock of 49 engines have, therefore, run, during the year ending the 30th September, ultimo, nine hundred and nine thousand, three hundred and eighty-seven miles, being an average of 18,550 miles to each engine.

The average of the thirteen first class engines, with freight alone, has been 15,968 miles—of the two second class, with freight alone, 12,351 miles—of the twelve third class, with freight and passengers together, 24,209 miles—of the twenty-two fourth class with freight and passengers together, 17,572 miles. From these numbers, however, deductions respecting the relative *efficiency* of the respective *classes* cannot be legitimately drawn, as some of each of the three first classes were placed upon the road since the beginning of the year, and consequently were not at work during the whole period. Had all of these engines been at work the full twelve months, the number of miles run by each class would have stood; for the first class, 18,220—second class, 13,654—third class, 25,485, and of the fourth class as before, 17,572 miles. The operations of the three third class engines, exclusively employed upon the passenger trains for the main stem, show satisfactorily their capacity in the performance of this description of duty; and it has amounted to the running of 109,154 miles for the three; or an average of 36,385 for each—the lowest being 33,122, and the highest 39,435. The average is at the rate of 100 miles a day for every day in the year, which is a most satisfactory performance—and the more highly to be appreciated, when the crooked line and imperfect structure of much of this road is considered. The number of miles run by the passenger engines, it will be observed, is much greater than that of the tonnage. This is no indication of inferior duty performed by the latter, but is the obvious result of the greater speed and lighter load of the passenger engines, and very much also of the greater regularity of the passenger business. It must be remarked that the duty of the second class engines appears so much less than that of the other classes, not from inferior efficiency, but from other circumstances which have given the two engines of this class less to do than they could have accomplished. This is particularly to be

said of the engine of this class which has done the work of the Mount Savage road; this engine being, in fact, one of the best in the service.

## PERFORMANCE IN TONS HAULED ONE MILE.

By this, the only perfect mode of expressing the duty of the engines, it would appear that the 44 engines employed in hauling freight have drawn one mile within the year an average of 652,207 tons upon the Main stem and Washington branch together, excluding the five engines of the third class which have been altogether engaged (three on the Main stem, and two on the Washington branch) in the passenger business, and converting the passengers hauled by those engines of the third and fourth class usually employed in the freight business into tons, at 12 passengers to the ton. The 44 freight engines of all classes being expressed by their equivalent in engines of the fourth or lightest class, would be represented by 75½ engines of that class—of which 72½ would belong to the Main stem and three to the Washington branch—and each of these engines would have drawn one mile on both roads an average of 380,094 tons in the period of twelve months. This tonnage includes materials and fuel distributed along the line for the company's use. If that be excluded, and the freight for which compensation has been received be alone considered, the performance of each engine expressed in its equivalent of the lightest class will have been 337,671 upon the Main stem and Washington branch, which if all the engines upon the road had been upon it the whole 12 months, would have been increased 4½ per cent., or to 352,863 tons one mile.\*

## COST OF REPAIRS OF LOCOMOTIVES.

*Main Stem*.—The whole amount charged to the account for the past year is, \$74,139 51—from which must be deducted \$3,119 28—for increase in stock of materials and duplicate parts of machinery—and the net amt, showing the actual outlay for the maintenance of the engines, is \$71,020 23. This is greater than the corresponding amount for the preceding year by \$14,969 06—and the increase is sufficiently accounted for by the addition to the number of the engines and the work done by them. The average number at work during the year 1846 was equivalent to 53½ of the fourth class, and during the year 1847 was equivalent to 74. Consequently the number of engines is greater by 39 per cent. The duty in tons and passengers carried one mile is also greater by 65 per cent, while the increase in repairs is but 27 per cent. During the past year the "improvements" in the engines were about equal in value to those which took place during the previous year, and amounted to some \$10,500. By this expenditure, included in the above amount of \$71,020 23, nine of the fourth class engines were thoroughly rebuilt, five of them of the old upright boiler four-wheeled pattern of Winans & Davis, and four of the six wheeled horizontal pattern of Wm. Norris—besides

\* NOTE. There have been placed upon the road, since October 1, 1846, 5 engines of the 1st, 1 of the 2d, and 2 of the 3d class.

which two other engines, one of the first and another of the fourth class, had copper furnaces applied to them.

The cost of repairs per mile and per ton per mile has been nearly as follows for the several classes:

	Per mile run.	Per ton drawn.
1st class.....	11-97 cents...	1696 of a cent per mile
2d ".....	7-18 " .....	1512 " "
3d ".....	7-22 " .....	3506 " "
4th ".....	8-07 " .....	3573 " "
General average—		
for all classes..	8-78 cents...	2505 of a cent per mile.

In this exhibit, the second class engine appears to have the advantage of the first, which in its turn, has greatly the advantage of the third and fourth. The comparison is not however a fair one, as between the first and second. As the only two second class engines in the service have been but a year at work, while the 13 first class engines have been an average of not less than two years upon the road, and have labored under some imperfections, in their smaller parts which have now been remedied. But for these circumstances and also, in a measure, the state of the road upon which the engines have run, and to the fact that the first class engines have been worked much harder than the second, it is not doubted that the economy of the first class in repairs, would have been considerably greater than that of the second.

*Washington Branch*.—The cost of repairs of locomotives, for the year just ended on this road, is charged at \$10,117 46; to which must be added \$1,034 52, for reduction in the value of materials on hand, making the true cost \$11,151 98, being \$954 13 less than the preceding year.

The cost of repairs per mile and per ton per mile, has been nearly as follows:

	Per mile run.	Per ton carried.
3d class.....	83 cents.....	14500 cents per mile
4th ".....	13-14 " .....	6415 " "
General average—		
for both classes..	11 cents....	7867 cents per mile.

The third class engines on this road have run altogether with passengers, which are here expressed by their equivalent in tons, at 12 to the ton. The cost per ton per mile is therefore large, as the tonnage is necessarily so light compared with dead freight. The fourth class engines have run with both freight and passengers. Their cost of repairs is also high, both per mile and per ton per mile. This is due to the fact that two out of the three engines of this class have been *rebuilt* during the year, after nearly ten years service. The general average cost of repairs and renewals of all classes of engines upon both roads, has been 10-14 cents per mile, and 30-97 of a cent per ton per mile. In the preceding fiscal year, ending September 30, 1846, the general result upon the *Main stem* was 8-4 cents per mile run, and 3270 of a cent per mile per ton carried, against 8-78 cents and 2505 cents in the year just ended; the increase of cost per mile run being but 4½ per cent.; and the decrease upon the cost of the real duty performed being 23½ per cent. This comparison simply shows how much more rapidly the useful effect of the motive power increases than the cost of obtaining that increase.

To be Continued.

**Gauge, or Width of Track for Railroads.**  
*Report on the Gauge for the St. Lawrence & Atlantic Railroad. By A. C. Morton, Esq., Chief Engineer.*

Continued from page 793.

The distance from Montreal by your main line to Portland, thence to Boston by steamboat or railroad, is but a trifle more than by your branch line, the Passumpsic, the Northern, the Concord, and other roads to the same point.

Between Portland and Boston there are steam vessels plying constantly, summer and winter. Passengers and all description of freight are carried on these steamboats at very low rates, in consequence of the competition with each other, and with the railroads.

A competition must always exist on this route between rival lines of boats and railroads, which will continue to keep the rates low for all time to come. It is well known that transportation can be done by steamboats and propellers at lower rates than by any other means of conveyance.

The facilities for the transshipment of freight at the Atlantic terminus, from your cars to vessels, will be of the cheapest and most superior character.

The location of the terminus is such as to afford more ample means and accommodations for an extended business, than perhaps any other railway terminus on the continent.

A connection with the roads extending from Portland to Boston is contemplated, by which a choice of conveyance is at all times afforded to merchandize and passengers going in that direction, while another connection with the eastern part of Maine and the lower provinces is in progress, opening a communication for trade and travel going eastward.

If the object is to reach Boston with merchandize from the interior or to forward it from Boston to the interior, there can be no doubt but that it can be carried cheaper on this line than by any other route to the St. Lawrence.

Although the distance from Boston by this route may be somewhat greater than by others, yet one-fourth of the whole distance between Montreal and Boston being by the cheapest mode of communication in existence and the remaining portion of the route being a continuous line of railway of great excellence and capacity, there is little reason to doubt the superior economy of this route.

If it is desirable to ship merchandize for Europe or any part of the United States, its delivery at Portland harbor gives in all respects equal or superior advantages.

With regard to importations made while the navigation of the St. Lawrence is closed, it may be observed that the more easterly position of Portland harbor and the greater safety and ease with which it is entered, will somewhat shorten the voyage, and the great saving in distance thence to Montreal will insure your main line the greater portion of this business, and affords additional reasons for a road of greater capabilities.

Your road is intended to form a large portion of the line to Quebec nearly equal to

half the distance between the latter place and Montreal, and while it thus composes a part of the main line between the two most populous cities of Canada, it furnishes to both a communication with the sea board, and the means of winter importations. When your main line is extended to Quebec and to the Atlantic, the citizens of both places may make their winter importations with the same regularity and safety as though they were located on the seaboard.

Merchandize going in either direction between Quebec and England during the suspension of the navigation of the St. Lawrence would probably take the shortest and cheapest route.

The people therefore of this part of the province have a direct interest in whatever tends to lessen cost of transportation on your road.

From the general views I have thus taken of the probable course of the trade of your road both to and from the seaboard, I am led to believe that the great mass of merchandize will reach Portland harbor and that with the exception of the Quebec trade it will pass over the whole length of your main line.

If this should prove to be the case, and there appears to be well founded reasons for looking forward to such a result, it is a subject of consideration in determining the gauge of your road, what importance is to be attached to the freight business of the Passumpsic branch compared with the great mass which will go in another direction.

It remains to be considered how far you will be warranted in reference to your peculiar position and the efforts now making to turn the trade from the St. Lawrence above Montreal, and also in regard to the great interest of the public, which is deeply concerned in whatever lessens the cost of transportation, and retains the trade in its legitimate channels; I repeat, it is for you to consider how far it would be wise, under the circumstances to lessen in any degree the capacity of your road.

In discussing the question of gauge as connected with the business of the Passumpsic branch, I have thus far confined my observations to the subject of merchandize transportation.

It now remains to be considered whether the adoption of a different gauge on your road from that of the Passumpsic branch will affect your passenger business unfavorably to afford less accommodation to the travelling public.

I beg leave again to refer to the system of railways in the United States, as perhaps affording the nearest approximation both in construction and management to what will be found from the similarity of the country and the nature of the business to be done, most suitable for Canada.

The line of railway between Boston and Buffalo is as before stated, 535 miles in length and is operated by ten separate corporations.

As every line yet projected from Montreal to Boston nearly resemble this in the proportionate number of corporations, and other circumstances, there appears to be much propri-

ety in referring to the management of passenger business on this line.

A number of these corporations own the passenger, baggage and mail cars jointly.

This arrangement extends from Rochester to Schenectady, a distance of 236 miles. On the remaining distance it is believed that the passenger cars belong to separate companies, each furnishing a proportionable number, if run over several roads.

The same cars run from Buffalo to Rochester, a distance of 73 miles, where a change takes place, the passengers are transferred to other cars; thence to Utica, a distance of 158 miles, the same cars are continued, where another change takes place.

At Schenectady, distant from Utica 78 miles east, there is another change where passengers are placed in the cars of the Schenectady and Troy road, thence to Troy the distance is 19 miles. It is contemplated to extend the cars from Utica to Troy, which will avoid the change at Schenectady.

After arriving at Troy, passengers for Boston take the cars of the Troy and Greenbush company, and again change at East Albany to the cars of the Western and Boston and Worcester roads which run to Boston, a distance of 200 miles.

Here, it will be observed, there are 535 miles of railroad on the same gauge forming one line and operating in connection, yet in this distance, there are five points at which passengers are changed to different cars.

It is as yet, I believe, only proposed to avoid one change. But so far as I have been able to learn there is little difficulty in effecting these changes, or objections raised to them by the travelling community.

On a long line with the proper arrangements for the transfer of baggage, there would be no objection on the part of passengers to a change of cars, for it would be a great relief after a long ride to change from dusty cars to those well cleaned and ventilated.

This transfer would probably take place at points where passengers would be furnished with refreshments or their ordinary meals, and I doubt not the opportunity would be gladly embraced by all as affording relief from the tedious monotony of a long railroad journey. The safety of passengers requires that cars should be run no greater distance than will permit frequent and careful inspection of all their parts, and this cannot well be done except at the end of the journey.

Between Boston and New York, there are changes from road to road, and from road to steamboat, and between New York and Philadelphia, and Philadelphia and Washington the same thing occurs.

These changes are generally looked forward to with pleasure, as it gives variety to the journey without adding to its inconveniences.

Changes are frequent and necessary for cross lines and branches. On the Western road, in Massachusetts, a transfer is made to several important branches, one of which forms a main line to New York.

At the commencement of the journey, the baggage is generally placed in enclosed crates

secure in every respect, each passenger receiving a check properly numbered, and a corresponding check is attached to each trunk or parcel, he is therefore under no apprehension about his baggage whatever the number of changes may be, and at the end of the journey he has only to present his check and his baggage is delivered.

In England it is customary to carry the baggage on the top of the passenger cars, and as every change of car involves a change of baggage, each piece is to be removed separately from the top of one car to that of another.

Frequent changes of this character would I doubt not be highly objectionable, and this I believe constitutes the main argument against a change of passenger cars in England.

But when the baggage is transferred from one road to another without unpacking it or opening the crates, the objections to a change of cars cease.

As an evidence of some of the difficulties of an extended interchange of cars in England, I would refer to the testimony of Mr. Edward Bury, of the London and Birmingham road, before the gauge commissioners. He states that they are put to great inconvenience in consequence of the public not desiring to change, and that the trains are loaded with carriages far beyond what is necessary for the number of passengers. That the average number of passengers in the first class cars is not eight, whereas they will accommodate eighteen.

Mr. Bury further states that in consequence of the great number of foreign carriages on their road, that they have one empty train each way daily, and that they have returned as many as 67 empty cars in one day. This is a very serious and unnecessary tax on the corporation, which in this country should be avoided.

In Canada and the United States, the main lines of railroad, when a great system shall have been perfected, will be more extended, embracing a vast extent of country, and it would be preposterous to attempt an interchange of cars, throughout the two countries or any considerable portion of them, and transfer of both freight and passengers will at various points be unavoidable.

There are now probably over 5000 miles of railways in operation in the United States, and in the management of so extensive a system much valuable experience has been acquired, yet the transfer of passengers on these railways is of common occurrence, and little is ever said about it, simply because the arrangements are ordinarily such as to relieve passengers from any anxiety about their baggage, and otherwise is to them a subject of indifference.

Judging therefore from the experience of these roads, it does not appear probable so far as the passenger business of the Passumpsic branch is concerned, that a difference of gauge at the boundary line would have any effect on the revenue of your road.

With the same gauge I do not think you would find it advisable to allow your passen-

ger cars to go out of the province in this direction.

The distance from Montreal to the boundary line by this branch is about 128 miles; and under the circumstances there appears much propriety in making this point the place of transfer, for it could not be expected, neither is it desirable, that your passenger cars should run over all these roads to Boston.

The statements given in another part of this report relative to the subject of merchandise transportation, will I trust aid somewhat in coming to a conclusion as to the probable amount of freight which will pass over this branch for shipment or for the Boston market. And I will further observe that it is desirable on account of convenience, regularity and despatch of business on your road, that your Boston trade should continue over the whole length of your main line, which, I believe, will be found to be for the interest of the public. The merchandise passing over your road for the Boston market will bear a small proportion to the amount destined for England and other markets; and your main line furnishing a better means of conveyance than the branch for through freight whatever its destination, renders the question of break of gauge on the Passumpsic branch of less importance.

I have already shown that a break of gauge constitutes no objection as it regards passenger business. And in view of your peculiar position with reference to competing lines and the probable course of trade, I am decidedly of the opinion that a break of gauge on the Passumpsic branch at the boundary line is preferable to an exchange of cars, and a sacrifice of the great advantages of a broad gauge on your main line.

There is another and more extended view of the question of gauge which is not only of great interest to your road, but of vital importance to the welfare and prosperity of all the provinces.

Canada and the lower provinces embrace an extent of territory of over 414,000 square miles, with a soil of unsurpassing fertility, possessing great agricultural and mineral resources, and inhabited by a hardy and enterprising population, numbering nearly two million souls. It is watered by the great rivers and lakes of North America, and these waters are teaming with the trade of the surrounding territories.

It requires no prophetic skill to foretell the greatness of a country thus situated, and the vast increase of wealth and prosperity which will attend a full development of its great resources by a judicious system of internal improvement.

Government, with a full appreciation of the importance of this country, and the great natural advantages of the St. Lawrence for cheap transportation, has embarked in a great system of canals, which are equal in importance and magnitude to any in the world.

It is not, however, a question whether the advantages of the St. Lawrence route are such as to retain the trade of the canals only, but it is rather whether these superior facilities shall not attract a large portion of the

trade of the American States bordering on the great lakes.

The rapidly increasing wealth and trade of the west are considerations of the greatest importance to both countries; and it is a question yet to be decided, which of the numerous rival routes to the Atlantic seaboard, will be able to attract the largest share of that trade.

The Atlantic cities, Boston, New York, Philadelphia and Baltimore, with the aid and encouragement of their respective States, are all striving with commendable zeal to secure this great prize.

Baltimore is pressing forward with her great railway, which is destined to scale the Allegheny ridge, and reach the Ohio river at Wheeling.

Philadelphia with all the advantages securing to her by the long line of state canals, which reach the Ohio river at Pittsburg, has now embarked in the construction of the Central railroad, which is to perfect the great line of railway communication over the same mountain range to the Ohio river.

In like manner New York with all the incalculable benefits conferred upon her by her magnificent canals and her great central chain of railways, is pressing vigorously forward with her Erie road to reach lake Erie at Dunkirk.

Boston not content with her Great Western road, and the control of the roads composing the great thoroughfare westward in other States, is now extending her arms in other directions, with a view more effectually to secure the western trade. She is advancing with the construction of another road to lake Champlain, thence to the St. Lawrence river at Ogdensburg.

She maintains that the opening of a channel of communication to the St. Lawrence at this point, will secure to her the balance of the trade of the lakes which does not reach her through the Erie and Oswego canals, and the Great Central railroad to Buffalo.

Another line from Cape Vincent opposite Kingston to Rome in the State of New York is in contemplation, where it will unite with both the Erie canal and the New York central line of roads, and thence the trade will reach Boston or New York at the option of the forwarders.

All these vast schemes of internal improvement have for their object the western trade.

Among the rival routes above referred to, there are several which have for their direct object the trade of the St. Lawrence, and will if not counteracted, divert a large portion of it from your canals, and Canada East.

In what light is the Ogdensburg road to be regarded, which is to form a direct railway communication from the St. Lawrence at that place to Boston? The great advantages of this line it is maintained by its friends consists in its ability to divert the trade of the upper province from its legitimate channel, the St. Lawrence.

(To be continued.)

**BACK VOLUMES OF THE RAILROAD JOURNAL** for sale at the office, No. 105 Chestnut street.

**RAILROAD IRON.—500 TONS OF THE**  
latest and most approved pattern of T Rail—  
weighing about 63 lbs. per yard, shipped from Eng-  
land in October, and shortly expected. For sale by  
**BOORMAN, JOHNSTON & CO.,**  
349 119 Greenwich St., New York.

**TO RAILROAD COMPANIES AND BUILD-  
ERS OF MARINE AND LOCOMOTIVE  
ENGINES AND BOILERS.**

### PASCAL IRON WORKS.

#### WELDED WROUGHT IRON TUBES

From 4 inches to 1 in calibre and 2 to 12 feet long,  
capable of sustaining pressure from 400 to 3500 lbs.  
per square inch, with Stop Cocks, T. L., and  
other fixtures to suit, fitting together, with screw  
joints, suitable for STEAM, WATER, GAS, and for  
LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by  
**MORRIS, TASKER & MORRIS.**  
Warehouse S. E. Corner of Third & Walnut Streets,  
PHILADELPHIA.

**RAILROAD IRON.—THE NEW JERSEY**  
Iron Company, Boonton, N. J., are now mak-  
ing Railroad Bars, and are prepared to execute or-  
ders for any required pattern. Apply to

**FULLER & BROWN, Agents.**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847. 10c

**CHILLED RAILROAD WHEELS.—THE**  
undersigned are now prepared to manufacture  
their Improved Corrugated Car Wheels, or Wheels  
with any form of Spokes or Disks, by a new process  
which prevents all strain on the metal, such as is  
produced in all other chilled wheels, by the man-  
ner of casting and cooling. By this new method of  
manufacture, the hubs of all kinds of wheels may  
be made whole—that is, without dividing them into  
sections—thus rendering the expense of banding un-  
necessary; and the wheels subjected to this process  
will be much stronger than those of the same size  
and weight, when made in the ordinary way.

**A. WHITNEY & SON,**

Willow St. below 13th,

Nov. 10, 1847. [if.] Philadelphia, Penna.

### LAP—WELDED WROUGHT IRON TUBES

FOR

**TUBULAR BOILERS,**  
FROM 1 1/2 TO 6 INCHES DIAMETER,  
and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manu-  
facture as those so extensively used in England,  
Scotland, France and Germany, for Locomotive,  
Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patente.

36 Plau street, New York.

**PATENT RAILROAD, SHIP AND BOAT**  
Spikes. The Troy Iron and Nail Factory keeps  
constantly for sale a very extensive assortment of  
Wrought Spikes and Nails, from 3 to 10 inches,  
manufactured by the subscriber's Patent Machinery,  
which after five years' successful operation, and now  
almost universal use in the United States (as well  
as England, where the subscriber obtained a patent)  
are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes  
having countersink heads suitable to holes in iron  
rails, to any amount and on short notice. Almost  
all the railroads now in progress in the United States  
are fastened with Spikes made at the above named  
factory—for which purpose they are found invalua-  
ble, as their adhesion is more than double any com-  
mon spikes made by the hammer.

All orders directed to the Agent, Troy, N. York  
will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I.  
& J. Townsend, Albany, and the principal iron mer-  
chants in Albany and Troy; J. L. Brower, 222 Water  
St., New York; A. M. Jones, Philadelphia; T. Jan-  
viers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward  
their orders as early as practicable, as the subscriber  
is desirous of extending the manufacturing so as to  
keep pace with the daily increasing demand.  
ja45

### MANUFACTURE OF PATENT WIRE

Rope and Cables for Inclined Planes, Stand-  
ing Ship Rigging, Mines, Cranes, Tillers etc., by  
**JOHN A. ROEBLING, Civil Engineer,**  
Pittsburgh, Pa.

These Ropes are in successful operation on the  
planes of the Portage Railroad in Pennsylvania, on  
the Public Slips, on Ferries and in Mines. The  
first rope put upon Plane No. 3, Portage Railroad,  
has now run 4 seasons, and is still in good condi-  
tion. 92v1 ly

### FRENCH AND BAIRD'S PATENT SPARK ARRESTER.

**TO THOSE INTERESTED IN**  
Railroads, Railroad Directors  
and Managers are respectfully in-  
vited to examine an improved Spark  
Arrester recently patented by the un-  
dersigned.

Our improved Spark Arresters  
have been extensively used during the  
last year on both passenger & freight  
engines, and have been brought to  
such a state of perfection that no an-  
noyance from sparks or dust from the  
chimney of engines on which they  
are used is experienced.

These Arresters are constructed on  
an entirely different principle from any heretofore offered to the public.  
The form is such that a rotary motion is imparted to the heated air,  
smoke and sparks passing through the chimney, and by the centrifugal  
force thus acquired by the sparks and dust they are separated from the  
smoke and steam, and thrown into an outer chamber of the chimney  
through openings near its top, from whence they fall by their own  
gravity to the bottom of this chamber; the smoke and steam passing  
off at the top of the chimney, through a capacious and unobstructed  
passage, thus arresting the sparks without impairing the power of  
the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use  
on the following roads, to the managers and other officers of which we are at liberty to refer those who  
may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintend-  
ant Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and  
Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norrit-  
town Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wil-  
mington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.;  
W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensse-  
laer, Engineer and Sup't Hartford and New Haven Railroad; W. R. McKee, Sup't Lexington and Ohio  
Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Mo-  
tive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Sterns, Sup't Elizabeth-  
town and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah,  
Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad,  
Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, Presi-  
dent Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whit-  
ney, of this city or to Hinckley & Drury, Boston, will be promptly executed. **FRENCH & BAIRD.**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasona-  
ble terms. Philadelphia, Pa., April 6, 1844.

•• The letters in the figures refer to the article given in the Journal of June, 1844. ja45

**PATENT HAMMERED RAILROAD, SHIP**  
and Boat Spikes. The Albany Iron and Nail  
Works have always on hand, of their own manu-  
facture, a large assortment of Railroad, Ship and Boat  
Spikes, from 2 to 12 inches in length, and of any form  
of head. From the excellence of the material al-  
ways used in their manufacture, and their very gen-  
eral use for railroads and other purposes in this coun-  
try, the manufacturers have no hesitation in warrant-  
ing them fully equal to the best spikes in market,  
both as to quality and appearance. All orders ad-  
dressed to the subscriber at the works, will be prompt-  
ly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y.  
The above spikes may be had at factory prices, of  
Erastus Corning & Co., Albany; Hart & Merritt,  
New York; J. H. Whitney, do.; E. J. Eting, Phil-  
adelphia; Wm. E. Coffin & Co, Boston. ja45

**MACHINE WORKS OF ROGERS,**  
Ketchum & Grosvenor, Paterson, N. J. The  
undersigned receive orders for the following articles,  
manufactured by them of the most superior descrip-  
tion in every particular. Their works being exten-  
sive and the number of hands employed being large,  
they are enabled to execute both large and small or-  
ders with promptness and despatch.

#### Railroad Work.

Locomotive steam engines and tenders; Driving  
and other locomotive wheels, axles, springs & flange  
tires; car wheels of cast iron, from a variety of pat-  
terns, and chills; car wheels of cast iron with  
wrought tires; axles of best American refined iron;  
springs; boxes and bolts for cars.

#### Cotton, Wool and Flax Machinery

of all descriptions and of the most improved patterns,  
style and workmanship.

Mill gearing and Millwright work generally;  
hydraulic and other presses; press screws; callen-  
ders; lathes and tools of all kinds; iron and brass  
castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,**  
a45 Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.  
Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trallis is 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trallis, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trallis for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.		
4,224 Timbers, 11 ft. long, 3 x 6 inches =	68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =		101 25
Workmanship free of patent charge =		600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

**JAMES HERRON.**  
Civil Engineer and Patentee.

President of the Newcastle Manuf. Co.

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

**SAM'L KIMBER & CO.,**

Willow Street Wharf,

Philadelphia, Pa.

1u

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its durability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

## ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—

for sale or imported to order by the subscriber.  
These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

ALFRED L. KEMP,  
75 Broad street, New York, sole agent in the United States.

*N.B. The working load, with a perpendicular lift, may be taken at 6 cwt. for every lb. weight per fathom, so that a rope weighing 5 lbs. per fathom would safely lift 3360 lbs., and so on in proportion.* 1y24

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; supposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

ELLICOTT & ABBOTT.

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

1y25

Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

G. A. NICOLLS,

Reading, Pa.

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

(Signed,)

WILLIAM ROE, Sup't of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

(Signed,) G. A. NICOLL,

Supt. Transportation, etc., Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

(Signed,) T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car. For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

(Signed,)

JOHN LEACH,

Jamaica November 12, 1845.

## THE SUBSCRIBERS, AGENTS FOR

the sale of

Codorus,

Glendon,

Spring Mill and

Valley,

Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

SAM'L. KIMBER, & CO.,

59 North Wharves,

Jan. 14, 1846.

(1y4)

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined B. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

THOMAS & EDMUND GEORGE,

245 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufactured and for sale by

MORRIS TASKER & MORRIS,

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

PETER COOPER 17 Burling Slip.

1y10

New York.

# NORRIS' LOCOMOTIVE WORKS. BUSHHILL, SCHUYLKILL SIXTH-ST., PHILADELPHIA,

**MANUFACTURE** to order Locomotive Steam Engines of every plan or size.

Their shops being enlarged, and their arrangements considerably extended to facilitate the speedy execution of work in this branch, they can offer to Railway Companies unusual advantages for prompt delivery of Machinery of superior workmanship and finish.

Connected with the Locomotive business, they are also prepared to furnish, at short notice, Chilled Wheels for Cars of superior quality.

Iron and Brass castings, Axles, etc., fitted up complete with Trucks or otherwise.

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,

12 Platt street, New York.

JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 281f

**S**PRING STEEL FOR LOCOMOTIVES, Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,

Albany Iron and Nail Works,

**T**HE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported.

REEVES, BUCK & CO.,

Philadelphia.

ROBERT NICHOLS, Agent,

No. 79 Water St., New York.

261f

**P**ATENT INDESTRUCTIBLE WATER

Pipes. The subscribers continue to manufacture the above PIPES, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York.

281f

J. BALL & CO.

**K**EARNEY FIRE BRICK. F. W.

BRINLEY, Manufacturer, Perth Amboy N. J. Guaranteed equal to any, either domestic or foreign. Any shape or size made to order. Terms, mos. from delivery of brick on board. Refer to

**BALTIMORE AND OHIO RAILROAD.****MAIN STEM.** The Train carrying the

Great Western Mail leaves Bal-

timore every morning at 7½ and

Cumberland at 8 o'clock, passing Ellicott's Mills,

Frederick, Harpers Ferry, Martinsburgh and Han-

cock, connecting daily each way with the Wash-

ington Trains at the Relay House seven miles

from Baltimore, with the Winchester Trains at

Harpers Ferry—with the various railroad and

steamboat lines between Baltimore and Philadelphia

and with the lines of Post Coaches between Cum-

berland and Wheeling and the fine Steamboats on

the Monongahela Slack Water between Browns-

ville and Pittsburgh. Time of arrival at both Cum-

berland and Baltimore 5½ P. M. Fare between

those points \$7, and 4 cents per mile for less distan-

ces. Fare through to Wheeling \$11 and time about

36 hours, to Pittsburgh \$10, and time about 32 hours.

Through tickets from Philadelphia to Wheeling

\$13, to Pittsburgh \$12. Extra train daily except

Sundays from Baltimore to Frederick at 4 P. M.,

and from Frederick to Baltimore at 8 A. M.

**WASHINGTON BRANCH.**

Daily trains at 9 A. M. and 5 P. M. and 12 at night from Baltimore and at 6 A. M. and 5½ P. M. from Washington, connecting daily with the lines North, South and West, at Baltimore, Washington and the Relay house. Fare \$1 60 through between Baltimore and Washington, in either direction, 4 cents per mile for intermediate distances. \$13y1

**LITTLE MIAMI RAILROAD COMPANY.**

Fall and Winter Arrangement, 1847. On and

after Monday, September 20th,

until further notice, a Passenger

train will run as follows:

Leave Cincinnati daily at 9 A. M., for Millford,

Foster's Crossing, Deerfield, Morrow, Fort Ancient,

Freeport, Waynesville, Spring Valley, Xenia, Yel-

low Springs, and Springfield. Returning, will leave

Springfield at 4½ a.m. Upward train arrives at

Cincinnati at 10½ a.m.

Freight trains will run each way daily.

Messrs. Neil, Moore &amp; Co. are running the fol-

lowing stage lines in connection with the road:

A daily line from Xenia to Columbus and Wheel-

ing, carrying the great Eastern mail.

Daily lines from Springfield to Columbus, Zanes-

ville and Wheeling. Also to Urbana and Bellefontaine.

A line of Hacks runs daily in connection with the train between Deerfield and Lebanon.

Passengers leaving for New York and Boston, arrive at Sandusky city via Urbana, Bellefontaine &amp; the Mad River and Lake Erie railroad, in 27 hours, including several hours' sleep at Bellefontaine. To the same point via Columbus, Delaware, Mansfield and the Mansfield and Sandusky city railroad, is 32 hours. Distance from Cincinnati to Springfield by railroad.....84 miles.

From Springfield to Bellefontaine by stage,

over a good Summer road.....32 "

From Bellefontaine to Sandusky city by

railroad.....102 "

FARE—From Cincinnati to Lebanon.....\$1 00

" " " Xenia.....1 50

" " " Springfield.. 2 00

" " " Columbus... 4 00

**SOUTH CAROLINA RAILROAD.—A**

Passenger Train runs daily from Charleston,

on the arrival of the boats from

Wilmington, N. C., in connection

with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery

daily.....\$26 50

Fare through from Charleston to Huntsville,

Decatur and Tuscumbia.....22 00

The South Carolina Railroad Co. engage to receive merchandize consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr, Agent.

25

THE WESTERN AND ATLANTIC

Railroad.—This Road is now in operation to

Oothcaloga, a distance of 80 miles, and connects

daily (Sundays excepted) with the Georgia Rail-

road.

From Kingston, on this road, there is a tri-weekly

line of stages, which leave on the arrival of the cars

on Tuesday, Thursday and Saturday, for Warren-

ton, Huntsville, Decatur and Tuscumbia, Alabama,

and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga

for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT,

Chief Engineer.

Atlanta, Georgia, April 16th, 1846.

1y1

**NEW YORK AND PHILADELPHIA RAIL-**

road line—direct. Via Newark, New Bruns-

wick, Princeton, Trenton,

and Bristol. (Through in

six hours.) Leaving New York daily from the foot

of Liberty street.

Morning line.....9 o'clock a.m.

Mail pilot line.....4½ " p.m.

The lines proceed direct to Bristol without change

of cars, and thence by the new steamer, "John Sie-

vens," to Philadelphia.

FARE BETWEEN NEW YORK &amp; PHILA.

First class cars.....\$4 00

Second class cars.....3 00

Passengers will procure their Tickets at the office

foot of Liberty st., where a commodious steamboat

will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each

passenger in this line, and passengers are expressly

prohibited from taking anything as baggage but

their wearing apparel, which will be at the risk of

the owner.

Philadelphia Baggage-crates are conveyed from

city to city, without being opened by the way. Each

train is provided with a car, in which are apart-

ments and dressing rooms expressly for ladies' use

Returning, the lines leave Philadelphia from the

foot of Walnut st. at 9 a.m. and 4 1-3 p.m.

The lines for Baltimore leave Philadelphia daily

except Sundays, at 8 a.m., 3½ and 10 p.m., and Sun-

days only at 10 p.m.—being a continuation of the

line from New York.

## AMERICAN RAILROAD JOURNAL.

PUBLISHED AT 105 CHESTNUT ST. PHILADELPHIA.

Saturday, December 25, 1847.

**T. & C. WASON**, Manufacturers of every style of Freight and Baggage Cars.—Forty rods east of the depot, Springfield, Mass.

Running parts in sets complete, Wheels, Axles, or any part of cars furnished and fitted up at short notice and in the best manner.

N.B. Particular attention paid to the manufacture of the most improved Freight Cars. We refer to the New Haven, Hartford and Springfield; Connecticut River; Harlem; Housatonic, and Western, Mass., Railroads, where our cars are now in constant use.

Dec. 25, 1847.—1y.

## THE CLOSE OF THE VOLUME.

This number—and the Index, which will soon be ready—will complete the volume—and the *fifteenth* year since the Journal was commenced. The change produced in Europe, and in this country, within that period, by the construction of railroads, though partially visible to the eye, can hardly be estimated.

By referring to the first number of the Journal—dated January 2d, 1832—we find that there were then in use the following roads, viz:

Baltimore and Ohio.....	61 miles.
Albany and Schenectady.....	12 "
Charleston, S. C.....	20 "
Manch Chunk.....	9 "
Quincy, Mass.....	6 "

Making in this country about..... 108 miles, while there was not then half that extent in all Europe completed; whereas now there is in this country at least four thousand five hundred miles in constant use, and about six thousand miles completed in Europe—by which the mode of travelling and the transaction of business is nearly revolutionised.

We find, also, that coal was selling in New York at that time, for *fifteen dollars* a ton! and hickory

wood at *thirteen dollars* a cord!! Whereas, at the present time, the first may be got for \$5.50 to \$6 per ton, and the latter at \$7 per cord, delivered. Then the people of New York paid, in winter, 6 to 8 cents a quart for milk, but now they get a better article for 4 to 5 cents. The evidence, of the advantage of railroads to the people of New York, may be inferred from the amount of a single article carried on the New York and Erie road, during the past year, viz: *ten million quarts of milk*—which at the former average price, six cents, would be \$600,000, and at the present average price, 4½ cents, the saving, on what passes over this road alone, will be \$150,000 a year—but, as not more than one-third, if even that proportion, of the milk used in the city comes by this line, the aggregate of economy to the people of New York, on milk alone, one of the smallest items of expense of house-keeping, is over \$450,000 a year!! But New York is not alone. If such are the advantages to New York, from her short lines now in use, how much greater will they be when her roads, now under way, shall be completed.

So with Boston, Philadelphia, Baltimore, Richmond, and other cities, as well as the vast interior of our wide spread country, are just beginning to derive the advantages of the railroad system; and, therefore, we may look for an extension of it, during the ensuing fifteen years, scarcely anticipated now, even by the most sanguine; and may we not venture to hope that the *RAILROAD JOURNAL* will grow with the growth, and strengthen with the spread, of the system?

## A WORD TO ALL.

**Missing Numbers.**—We again remind our subscribers that we shall cheerfully supply missing numbers for the current and past volumes—if we have them to spare—on receiving a list. It is much more easy to supply them now than at any future period.

If we have omitted to comply with any of the applications heretofore made for missing numbers, it has arisen from inability at the time—not from indisposition—it may therefore be worth the labor of furnishing a new list, as we have received many loose numbers of back volumes, from which they may possibly be supplied.

We learn, from the *Detroit Advertiser*, that the Central railroad company have determined to build, during the winter, a steamer to run between Detroit and Buffalo, in connection with the road. The boat

is to be of 1000 tons burthen, and built expressly for speed and strength.

## Novel Speculation.

A mercantile house at Berlin has proposed to all the railway companies of Germany to supply all their carriages with silk blinds for nothing. They simply propose to reserve to themselves the right of changing the blinds as often as they please, and they require the companies to engage themselves not to accept, during fifty years, either for money or gratuitously, any blinds but theirs. Their object is to cover the blinds with advertisements.

## Baltimore and Ohio Railroad.

Engineer's and Superintendent's Report.

We complete, in this number, this able and useful report, with the exception of the tables.

From this report it appears that the *plate rail* east of Harper's Ferry, is fast disappearing—and the *Ω* rail is laid in its stead, a measure highly important, as will be seen by the tabular statement, showing the comparative cost of keeping the road in repair. There appears to have been a great care given to the business of the road, and to the classification of the expenses of working it. The comparative cost, of repairs of locomotives, appears to be decidedly in favor of those termed *first* and *second* class, or the heavy engines. The same may be said of the expense of working them.

This report may be profitably consulted by all who are engaged in the management or construction of railroads.

## Gauge Question.

We complete, in this number, Mr. Morton's able report on this question. It has been divided into several parts, to avoid filling up two or three numbers with one subject; yet it is completed in this volume, and may therefore be referred to, when bound, without inconvenience.

Mr. Morton has labored with industry and ability to establish his positions, and has been successful with his directors, who have adopted the *5½ feet* gauge. The New York and Erie company have also decided to continue their work on the original—*six feet*—gauge; and Mr. Brunel has succeeded in extending his favorite—*seven feet*—gauge, from Gloucester in the direction of Birmingham, by means of the "*mixed gauge*," or three rail track, by which both the broad and narrow gauge trains can pass over the line. Upon this road, if upon any, we should think this vexed question might be thorough-

ly tested, as the grades, curves and construction of the road are the same. Now let the best engines of the different gauges be placed in the hands of disinterested persons, who will give them a fair trial, without regard to the makers, or railroad companies, and then make a full report. Not that such a course will bring about a *uniformity*, and remove the difficulty of the present diversity, of gauge, but it will enable those who hereafter construct roads in the new States to adopt the most useful width.

#### Schuylkill Coal Trade.

PHILADELPHIA AND READING RAILROAD.—Amount of coal transported during the week ending Thursday, December 16, 1847.

	Tons, cwt.
From Port Carbon.....	5,578 17
" Pottsville.....	2,095 01
" Schuylkill Haven.....	9,871 08
" Port Clinton.....	1,826 15
Total for week.....	19,371 11
Previously this year.....	1,307,083 07
Total.....	1,326,454 18

#### Bituminous Coal—The Moshannon Basin.

The importance of the coal trade of Pennsylvania is just beginning to be appreciated—though still quite in its infancy—yet there are very few indeed on this side of the mountain, who know anything of the riches of the *bituminous* coal fields of the State.

Much has been said of the bituminous coal fields of Maryland and Virginia, and sometimes those of Ohio are spoken of—but there is comparatively little known to us—who are so familiar with the *anthracite*—about the much more extensive regions of bituminous coal in the interior of the State, for the reason, we suppose, that there has been no cheap and easy mode of getting it to an eastern market. The time is not distant, however, we hope, when there will be a supply of this very desirable article in all the Atlantic cities; that those who prefer the cheerful blaze of bituminous coal to anthracite, may have it at a reasonable rate. There is a fair prospect, we infer, from the following communication, that there will soon be an opening to the *Moshannon* basin—which we understand to be the easiest of access from this side of the Allegheny mountain—from which an ample supply may be obtained through the medium of the Pennsylvania canals and the Central railroad, by the construction of a branch of only ten miles. This branch may be made probably for less than \$10,000 a mile—and, when made, will be profitable to its stockholders, if the coal mines are—as they surely will be—properly worked; and we shall feel that we have done good service to the many, if we can be in any way instrumental in directing attention to the subject, and of getting the coal into the market—but to the remarks of X. Y. Z.

For the American Railroad Journal.

#### The Moshannon Bituminous Coal Basin.

This is the most eastern of the series of bituminous coal basins, which, lying on, and west of the Allegheny mountain, extend through Pennsylvania down to the Gulf of Mexico. As its centre coincides very nearly with the course of the Moshannon creek in Centre and Clearfield counties, the strata on each side dipping gently towards the stream, it may, for convenience, be called the "*Moshannon Bituminous Coal Basin*."

The coal of the many veins of this basin differs. The structure of some is columnar, the strata distinct, lustre jet black and shining; others are massive, with an irregular fracture. It is generally of a sound texture, and will afford solid blocks of the thickness of the beds, and as much as eight feet long.

The coal from some of the veins is uncommonly free from sulphur and slate, and is exceedingly well adapted to domestic purposes, burning in grates, stoves, etc.; some for the generating of steam, and others for smithing and the making of iron. It kindles easily and quickly; burns with a bright blaze; has very little ashes, and gives off but little or none of the soiling, black smoke of the Liverpool and other bituminous coals. In the production of a bright beautiful fire, combining heat, cleanliness, cheerfulness, ease of kindling, length of burning without replenishing, it is unrivalled. It yields as pure a coke as any known coal.

There is one vein of nine feet thickness; two of six; one of four feet four inches; one of four feet, and several others.

The *dip* is so slight as to afford uncommon facilities for mining. It is now mined in considerable quantities at a very small cost. Drifts are cut into the sides of the hills at such an angle as will allow of just sufficient fall for draining. The veins are all *level free*, i.e., they drain themselves: thus avoiding the great expense incurred in some districts in raising both the coal and water by steam power.

The veins of coal are interstratified with limestone, iron ore, fire clay, slate and sandstone. A brown iron ore is found loose in the fields over a large extent of country.

The Moshannon coal basin may be considered to be from twenty-five to thirty miles in length, and seven to nine in breadth. Its southern boundary, however, is not well defined, as it runs into the Clearfield basin; which in like manner unites with others southwesterly.

In quantity the coal is inexhaustible. This one basin will afford a supply for any demand that will probably exist for many centuries.

The coal veins along the southeast side of the basin, near the top of the mountain, do not correspond exactly with those above described. They have been developed in the dividing ridge, called "*Coal Hill*," between the *Cold Stream* and *Trout Run*;—streams flowing into the Moshannon. This elevation slopes gently from the west side of the Allegheny, opposite to both "*Emigh's Gap*" and "*Miller's Gap*;" the former being the *lowest depression* of the Allegheny range.

The seams of coal in Coal Hill have been estimated to occupy as much as sixteen square miles of surface in the country between Trout Run and Cold Stream. Its position is exceedingly advantageous, as the PENNSYLVANIA RAILWAY, now constructing, will approach within *ten miles* of its mines. By this means this vast bituminous coal basin will soon be open to the Atlantic markets. A railway of ten miles in length, with grades all descending towards the Juniata river, and fifteen miles, or less, of the Pennsylvania railway, will enable the coal to be loaded into boats of 80 tons burden, on the Juniata canal at Petersburg, in Huntingdon county. The route will be, from "*Coal Hill*" to Petersburg, 25 miles, by railway; thence, 183 miles to *Havre de Grace*, by the Juniata, Susquehannah, and Tide Water canals. The completion of the Pennsylvania railway to Logan's Narrows, and the construction of the branch of ten miles, will, it is believed, render the Moshannon coal field equally if not more accessible to tide water than any other bituminous coal in the United States. The facilities for mining are such, and the advantages of its position are so great, that it will probably be sold at a lower rate in the cities of the seaboard than any other coal of its class.

A variety of circumstances has caused the anthracite coal basins of Pennsylvania to attract much at-

tention, while the bituminous coal fields have scarcely been noticed. Much has been said in vague terms of the great mineral wealth of the State; but comprehensive and accurate knowledge on the subject is rare. The statistics of anthracite coal have been industriously collected and extensively published; those of bituminous are known to but few. It is thought that if it will not be one of the least of the benefits which will accrue from the *Pennsylvania railway*, that it will bring to public view and use the vast undeveloped resources of the "*Moshannon Coal Field*."

According to the census of 1840, 920,136 tons of bituminous coal were mined in 1830 in the United States. Of this, 387,355 tons were mined in Pennsylvania. Since then the amount has greatly increased. X. Y. Z.

#### Cast Iron Rails.

We find in the London Mining Journal, for 12th August, the following description and illustration of a cast iron rail, invented and patented in this country by Mr. Richard Imray, of New York, and in England by Mr. Egbert Hedge. There have been, and are now, serious objections to the *cast* rail, arising from the belief that they are not safe; and therefore they have not had, as we think, a fair trial.

This plan, it will be seen, is different from any that has been tried before. The rail has not only a broad bearing upon the wood, but it is also confined between two pieces in such a way that, even if it should break, it cannot get out of place, and the trains will pass as safely over them when in short pieces as in whole lengths; but they are not very liable to break, as we had an opportunity to learn recently, by examining the Harlem railroad in New York, between 28th and 30th streets, where they have been in use more than a year, not only subject to the passing of trains on, but also of loaded carts across, them, without a single fracture that we could see.

Being without the figures, we cannot give the comparative cost of this description of road; yet we consider the plan deserving consideration, and therefore ask for it the attention of our readers.

[Specification of patent granted to EGEBERT HEDGE, No. 9 Howard street, in the parish of St. Clement's Dunes, Middlesex, gentleman, for certain improvements in rails for railroads, and in the manner of securing them.]

Fig. 1.

Fig. 2.

This invention consists, first, in a new form and construction of rail; and, secondly, in the mode of securing such rails to their longitudinal sleepers, by imbedding the lower portion of the entire length of each rail in sleepers, grooved to receive such part in the manner exhibited by the drawing in Fig. 1, which represents a transverse and vertical section of a rail and sleepers. It will be seen upon referring to this figure, that the rail is formed with (what the inventor terms) an upper table (B) and under table (C), and that the shoulders of the upper table rest upon the upper edge of each of the longitudinal timbers (DD),

which have grooves formed therein, and extending throughout the entire length of each sleeper, for the purpose of receiving that portion of the rail termed the under table (C), which, when placed therein, is firmly secured in this position, by pins or keys (E) being passed through holes in the sleepers, as shown at Fig. 2. At the points of junction of each length of rail, the inventor proposes making the upper table (B) of the rail wider than the other part; and there are 'half-round' holes (F) formed at the ends of each rail, which, when brought together, form an entire hole, into which a pin or key (G) is passed, the ends resting in holes in the sleepers (DD), as shown. This arrangement, whilst it serves to connect each length of rail together, allows it lateral movement for expansion and contraction. The inventor proposes employing rails of cast iron, except at those parts of a line of railway where crossings are required, in which case he proposes to employ wrought iron rails of the ordinary form, and laid in the usual manner. The inventor claims—firstly, a rail, with an upper and under table and shoulders, as described. Secondly, the clamping of rails in sleepers, grooved and keyed, as described. Thirdly, the combination of rails and sleepers as described.

*Patent Office & Designs Registry*  
310, Strand, August 18. }

#### Rolls for Rolling Iron.

The following is the plan and patent of Thomas Payne, of Wandsworth, England, for improvements in rolls for rolling mills: It is from the London Mining Journal. He says—

"The invention relates to improvements in the mode of rolling iron and other metals. In constructing rolls for such purposes, it has heretofore been used to cast rolls with necks, or axles at their ends, such necks or axles being liable to be broken when in use; and it has also been attempted to cast rolls on to bars of iron, such rolls of iron being intended to strengthen the axles or necks of the rolls; but in all such cases the inventor states that bars of iron so used are much injured, being weakened, and unfit for such purposes; but in order that the important peculiarities of his invention may be more fully understood, he has given (which he believes to be) the present mode of manufacturing the rolls aforesaid, that is to say—in carrying his invention into effect, the inventor states that in casting rollers, of any given size required, it will be necessary to leave the interior of any such roller hollow, so as to admit of the shaft or axis being passed through, and fixed therein by keys or otherwise; care being taken in casting, that the hollow space within a roller is cast or formed truly, so that the shaft when introduced shall fit accurately, allowing spaces for driving in wedges or keys at the end of the roll, which keys should be securely retained from moving by shrinking wrought iron collars on the shaft or axles; the working journals are turned in the wrought iron shafts, after keying on the rolls, and the surfaces of the rolls turned; by which means of manufacturing rolls for rolling iron and other metals the inventor is enabled to obtain them with stronger necks or axles. The wrought iron shafts or axles are passed through hollow rolls, which the inventor prefers to be cylindrical openings in the cast iron rollers, but the inventor does not confine himself thereto, as other shapes may be used; but he

claims the manufacture of hollow cast rolls for rolling iron and other metals, and fixing thereunto wrought iron shafts or axles, as hereinbefore described."

#### Gauge, or Width of Track for Railroads. *Report on the Gauge for the St. Lawrence & Atlantic Railroad. By A. C. Morton, Esq., Chief Engineer.*

*Continued from page 805.*

An able advocate of this road in a document published in Boston, after dwelling upon the difficulties of the navigation of the St. Lawrence below Ogdensburg, the objections to the canals, and the importance of the trade of the upper province, observes, "for these reasons the Ogdensburg route to Boston would have a decided preference over the Montreal route to Portland. But if the western trade can go by Montreal at all, and is permitted to go there, then there is no probability that Boston would take any share of it. Preference of course would be given to the British carrying trade so far as legislation could do it, and if any portion of it must find an outlet at an American port, no doubt Portland would be the place."

From this it appears that if the trade of the upper province is permitted to go down the St. Lawrence river, or through our canals, it would, in that case, not be likely to reach that American port, but would find its way to the ocean in British vessels.

It has been suggested that the Ogdensburg road would not materially affect the business of the canals; for the construction of a road from Montreal to the boundary line, in the direction of Burlington, connecting with the Ogdensburg road, would open a communication whereby the trade would come through the canals to Montreal and onward to Boston.

It is hardly reasonable to suppose that trade will pass the Ogdensburg road, and take so circuitous a route, going an increased distance of 60 or 70 miles, passing Montreal, and thence in order to reach Boston, return to the same road at lake Champlain.

This is manifestly well understood by the capitalists who have embarked in the construction of the great line to Ogdensburg, and they are fully aware that the trade must be taken by them from the St. Lawrence at Ogdensburg, or the great mass will never reach Boston.

The distance from the St. Lawrence river at Ogdensburg to lake Champlain by the Ogdensburg road, thence over the several lines of railway to the seaboard at Boston, will not differ materially from the distance from the same point by the Saint Lawrence river to Montreal, thence over your road to the seaboard at Portland. The question, therefore, as to which channel of communication the western trade will take to the seaboard seems nicely balanced, and it will preponderate to that route which will furnish the greatest facilities, and the cheapest mode of transportation.

All the rival lines of the States which approach the frontier between Buffalo and Ogdensburg will exert their influence in favor of a narrow gauge in Canada, not because

it is the best, but from the fear of the great superiority of a wider gauge, and their inability in case it is adopted, to compete so successfully in drawing off your trade. The countries are separated by natural boundaries—the great lakes and the St. Lawrence river from lake Superior to St. Regis—and at no point within these limits is it practicable, consistent with the navigation of the river, to connect the railways of the States with those of Canada, except at Niagara Falls.

Although it is proposed to erect a suspension bridge at this point, whereby a connection may be formed with these railways, yet I am fully convinced that no railway company in Upper Canada will ever find it for their interest to allow their cars to cross Niagara river, for the purpose of running over the numerous roads of New York and Massachusetts, a distance of five hundred miles to the seaboard. This, with reasonable economy and despatch, is impracticable. There must, unavoidably be a change, and the probable point would, in this case, be at Niagara river. And I am informed by a person of high standing connected with the lines in Upper Canada that it is not contemplated that their cars, except baggage cars, will run over the roads of New York. I have already shown that there would be no necessity, even for this, were the same system of transferring baggage adopted here as on other main lines of the United States. The great business of the roads of Upper Canada will be in connection with your lake, river and canal navigation, and with the roads of the lower provinces.

In deciding on a system of railways for the provinces, which are to co-operate with the river and the canals, in contending against these powerful rivals for the western trade, it becomes a question of vital importance to the people of Canada, that your railways should have a greater capacity than those of your enterprising neighbors.

The St. Lawrence river and its auxiliaries—the stupendous canals of Canada—afford a line of navigation superior to any of your rivals, and should your various chartered railroads be constructed with the same liberal policy as regards capacity which characterize your canals, and the same regard to the great interests of the provinces at large, there need be no apprehension as to your ability to retain your own trade or to compete successfully for that of the lakes.

In this country there is about to be commenced a system of railways which will eventually extend thousands of miles. Already have lines been projected which reach from Halifax to lake Huron, passing the whole extent of the country, connecting your inland seas, rivers and canals, with your Atlantic coast, and joining all the provinces together in one iron band of union and commercial intercourse.

How important is it, therefore, in the commencement of this system, and before any of the links of this great chain are completed and fixed beyond remedy, that the subject of gauge should be definitely determined for all the provinces, and that it should be that which

the experience of every country in which railways have yet been constructed, has been found to be desirable, and above all, that which the position and wants of this country demand?

The question of gauge here is a different one from that in England, and many of the arguments which apply there with much force have no bearing on the subject here.

The agitation of the question there has been not as to the best gauge for an entire new system of railways, but generally a contention between two parties actuated and guided by personal feelings, and strong pecuniary interest, in favor of two extremes, neither of which it is generally admitted is what is wanted.

In recommending a gauge for your road, I have not been guided by a limited or sectional view of the provinces, but in reference to the state of the whole country, its wants and capabilities, and the adoption of such a width of track as experience seems to point out as desirable for a perfect railway.

The width (5½ feet) is not what is termed the narrow or broad gauge, but is such a medium that while it avoids the objections to both extremes it combines all the requisites of a most superior road.

It is such that while it affords to the public the most ample means of communication, superior in all respects to the generality of roads it does not by its greater capacity impose a burden or a tax on the smaller branches or unimportant lateral lines whose business may be less, and whose means of construction are limited.

Your road was regarded as one of great importance, forming part of the main trunk through the provinces; it was the first road commenced (except one of 15 miles length) in the country, and therefore in determining the gauge a great responsibility had to be assumed.

The arguments favoring an increased capacity for your road apply with corresponding force to all the railways of the provinces and it is not now too late to bring about uniformity.

In this view of the case, I would earnestly appeal to the opinions of engineers in England, and to the decision of the British government as furnishing the most full and convincing proof of the position I have maintained.

The experience of English engineers should and must have great weight with us in the discussion of this question, and we should turn our attention to their opinion, as no doubt forming the best grounds for a just estimate of the *value of gauge*. The question of the best gauge for Ireland was finally settled in 1843 by Major General Paisley, inspector general of railways. He obtained the opinion of engineers and engine builders of the greatest experience.

The opinions of the 14 gentlemen to whom he addressed his inquiries, showed conclusively that a wider gauge than 4 feet 8½ inches was the best. The average of their opinions was 5 feet 3 inches, and General Paisley decided upon this width, which has been adopted by parliament for Ireland.

Since that date the report of the gauge

commissioners has given us evidence that a still wider gauge than 5 feet 3 in. has advantages over a less width in reference to power and economy.

It is well known that the commissioners in the examination of the subject, came to the conclusion that, under the circumstances, there being 1901 miles of narrow, and only 274 miles of broad gauge, roads in Great Britain in operation, that in future all roads to be constructed should conform to the narrow gauge, and if a uniformity was required among those already constructed, the change should be from the broad to the narrow gauge. This conclusion was arrived at, not from the alleged superiority of the 4 feet 8½ in. gauge, over any intermediate one between it and 7 feet, but as the best means in their opinion of obviating the difficulty of a break of gauge in England.

But in connection with this part of the subject, the commissioners observe, "We are desirous however of guarding ourselves from being supposed to express an opinion, that the dimensions of 4 feet 8½ in., is in all respects the most suited for the general objects of the country."

The object of the inquiry was solely to devise means whereby under the particular circumstances in which the railways of England were placed, the real or supposed difficulty resulting from a break of gauge, might be remedied, and therefore no opinion was expressed by the commissioners as to the best gauge for a new system of railways in a country where few or none had yet been constructed.

The publication of the testimony taken before the gauge commissioners, brought the whole subject fully before parliament.

This testimony, with singular unanimity of opinion, established the desirableness of a wider gauge than 4 feet 8½ in.

No less than 19 out of 21 persons whose testimony was required on the *abstract question as to what gauge was in itself the best* gave opinions in favor of a greater width than 4 feet 8½ in. Parliament referred the report of the gauge commissioners to the lords of the committee of privy council for trade.

The board of trade, instead of advising entire uniformity of gauge as recommended by the gauge commissioners, say: "They are unable altogether to concur with the commissioners in the full extent of these recommendations," and further observe: "They would therefore recommend that the lines for which acts have been obtained, but which have not yet been completed, to the south of the line from London to Bristol, should be permitted to be constructed on the broad gauge as originally intended." And again add, "In suggesting therefore (with some exceptions to be specified) the adoption of the recommendation made by the commissioners, that the '4 feet 8½ in. gauge should be declared by the legislature to be the gauge to be used in all public railways,' hereafter to be constructed in Great Britain,' they do not conceive that any declaration on this point should be understood as positive and final. The working of the wider gauge established in

Ireland, and the future history of railways in other countries, may possibly prove the superiority of some other and intermediate gauge, while the advance of science and the course of experience may point out a practical method of altering an existing gauge, and of easily effecting a great operation which is now generally conceived to be so costly and so difficult as in truth to be impracticable."

The decision of parliament was a full vindication of the opinion of the most skilful engineers and engine builders in the kingdom. And parliament established on their recommendation a gauge of 5 feet 3 in. for Ireland where the question was open and unembarrassed.

The statute of 9 and 10 Vic., cap. 57, enacts, that 5 feet 3 in. shall be the gauge for Ireland, and that all railways southward of the line of the Great Western railway (from London to Bristol) shall be of the gauge of 7 feet, and that those north of this line, excepting certain independent lines and roads connecting with the Great Western, shall be of the gauge of 5 feet 8½ in.

This decision was all that the friends of the broad gauge could reasonably desire, and the deliberate judgment of the British parliament may fairly be considered as adopting a gauge of 5 feet 3 in. as abstractly the best.

Had parliament been called upon at the same time to establish a gauge for the provinces, there is little doubt they would have decided upon a gauge similar to that for Ireland.

The gauge for Canada should be wider than for Ireland. The same arguments which induced the adoption of 5 feet 3 inches there, would lead at least to 5 feet 6 inches here.—The power should be in proportion to the magnitude of the business to be done, and it is evident that the long lines of railways to be built in Canada will be required to transport a vastly larger tonnage than in a country of such limited extent as Ireland.

It should also be recollected that the nature of much of the freight in Canada which would pass over your roads is bulky and heavy compared with its intrinsic value, unless therefore it can be carried in large quantities, and consequently at comparatively a cheap rate, it cannot be transported at all, for the expense will absorb too much of its value.

These considerations fairly carried out, with reference solely to the question of capacity as affected by the gauge, would lead us to the adoption of a gauge wider perhaps than 5½ feet, but we have taken this limit in consideration of the question of expense, as applied to the branch lines, as well as to the long main lines which are to be constructed coupled with the opinions entertained by the respectable engineers above quoted and my own that 5½ feet will give every desirable advantage.

There appears to me no room to doubt this, and my sense of duty and regard to the interest of the stockholders, constrains me to urge all honorable means to secure to your road the advantages of the 5½ feet gauge.

In recommending a wider gauge than the prevailing one, I would not be understood as

desiring to erect any barriers, or interpose any obstacles to the accomplishment of the objects sought by the promoters of rival lines. For they, in fact, open communications to good markets for the people of Canada, and they will of course be benefited not only by these avenues, but by the competition likely to arise as rival lines are increased.

But what I would recommend is simply that you give to your own lines all the superiority over your rivals which the experience of England and America has shown to exist in a broader gauge, and leave to the enterprise of our neighbors to overcome these advantages as they best can.

I have the honor to be, Sir,  
Your obedient servant,  
A. C. MORTON,  
Chief Engineer.

From the London Mechanics' Magazine.

*Improvements in Blast Furnaces, patented by Mr. James Yates, Masborough, Yorkshire, December 14, 1846.*

The patentee states, that it is usual to keep the charge, in blast furnaces of ordinary construction, for as long a time as is comparable with the iron made; and that it is deemed beneficial to continue the cementing process, which is the result of the iron stone, or ore, and fuel, being subjected to a great degree of heat for several days; but that he believes this system of operation to be erroneous.

Again, under the system which has hitherto prevailed, furnaces are kept filled up to the funnel head, through which the flame and unconsumed products pass on escaping from the charge; and these furnaces are constructed in the form of two cones united at their bases, or of a cylindrical form at top; both of which forms of construction offer scarcely any obstacle to the free escape of caloric with the unconsumed products.

Now Mr. Yates proposes *firstly*, to arch in the upper part of the furnace, and diminish its height, in order that a very considerable portion of heat, instead of escaping as heretofore, may, after striking against the even surface of the dome, be deflected on the top surface, of the "burden" and absorbed by it. *Secondly*, to place feed doors, by which the material may be introduced in the side, at that point of junction between the dome and the bottom part of the furnace which allows of the largest surface of the burden being exposed to the action of the deflected heat (care being taken to maintain a sufficient and uniform space between the dome and the top of the "burden" for the purposes of reverberation); by which mode of charging the furnace the "burden" is hollow in the centre, and therefore offers less resistance to the blast, which is regulated by means of dampers suitably placed in the chimney. And *thirdly*, to employ a greater number of tuyeres, and to distribute them more equally round the hearth of the furnace than has yet been customary; and to provide each tuyere with a separate house, in order that the blast may act more regularly on the "burden."

The results of these alterations are stated to be saving in the prime cost of erection, and economy both in fuel and in engine power.

Mr. Yates instances a furnace, built according to his invention, which was 20 feet from the hearth to the top of the "burden," and had six tuyere pipes of seven eighths of an inch in diameter; with this furnace he produced, employing a hot blast at a pressure of 1 1/2 lbs. to the square inch, 110 tons of iron, from lean Derbyshire ore in one week.

The patentee proposes to adapt his plan of construction to existing furnaces, by building the dome in the top or other part of the shaft, and providing feed doors together with the necessary holes for the extra number of tuyere pipes.

After pointing out various modifications of which his invention is susceptible, such as, the substitution for tuyere pipes, of a circular passage, with grating to keep in the burden, Mr. Yates proceeds to describe a peculiar apparatus for feeding by the chimney instead of by side doors, which enables him to obtain the same result, viz: the distribution of the material around and upon, and not in, the centre of the burden. The apparatus referred to is fixed in the dome, and consists of a cone, having an aperture in its centre for the passage of unconsumed products, and is adjusted to the required size. The cone is made fast to a lever passing through the chimney, and weighted at the outside end;—so that when there is no disturbing force, its weight shall keep the cone wedged tight up into the dome, and leave no room for the escape of any vapor or caloric, except through the aperture. A feed box is suspended in the chimney, and has a conical bottom, similarly connected to a weighted lever, which, when the box is filled, falls down, and allows the passage of the material; the centre aperture of the under cone being covered by the bottom of the feed box. The weight of the material falling on the surfaces of the under cone, overcomes the weight at the end of the lever, and depressing the cone, passes into the furnace around the sides. When there is no longer any weight on either the cone portions of the dome, or the conical bottoms of the box, they both return to their places.

Other modifications described in this specification are, the connecting two or more furnaces to a common chimney, by flues provided with dampers to regulate the draught; the making the furnace of as great a diameter at the bottom, just above the hearth, as at the other point of junction with the dome, or even greater: and a peculiar construction of tuyere box, to avoid, in a great measure, the melting of the tuyere pipes.

The patentee describes, lastly, some improvements relating to steam engines and cylinders employed in blasting, which may be said briefly, to consist in working two engines together, by connecting the slide valves and rods of the one to the piston rod of the other, and *vice versa*, so that the piston at work shall open the valves of the one at rest—and in using an elastic cylinder attached immovably at one end of the main, and at the other to the piston rod. By the use of this elastic cylinder, Mr. Yates states that a more regular pressure of the blast may be obtained.

# Baltimore and Ohio Railroad.

Superintendent's Report.

Continued from page 507.

## BURDEN CARS.

The stock of freight cars of the different classes owned by the company is as follows: 314 eight wheel, weighing about 5 and carrying 6 tons each—50 four wheel house cars, weighing 2 and carrying 2 1/2 tons—57 cars for live stock, (24 of them divided by partitions for horses and cattle) weighing 5 and carrying 6 tons—163 eight wheel gondola or box cars, weighing about 4 1/2 and carrying about 8 tons—62 four wheel box cars, weighing 1 1/2 and carrying 2 1/2 tons—24 eight wheel bolster cars for lumber, weighing 2 1/2 and carrying 7 tons—30 eight wheel stone cars, weighing 3 1/2 and carrying 7 tons—25 four wheel stone cars, weighing 1 1/2 and carrying 2 tons—12 eight wheel platform cars for hauling iron, weighing 4 and carrying 7 tons—4 eight wheel cars for fire wood, weighing about 3 1/2 and carrying 8 tons—one iron eight wheel cylinder car for general freight, weighing about 6 tons and carrying 8 tons—one four wheel iron cylinder car for carrying gun powder, weighing about 2 and carrying 2 1/2 tons—201 six wheel iron hopper coal cars, weighing 2 1/2 and carrying 7 1/2 tons—one eight wheel iron hopper coal car, weighing 3 1/2 and carrying 8 1/2 tons—one four wheel iron hopper coal car, weighing 2 and carrying 5 tons and 37 wooden hopper coal cars, weighing 3 and carrying 7 tons—making 606 eight wheel, 238 six wheel, and 139 four wheel cars—and a total of 983 cars of all classes, and 6832 wheels. These cars are used indiscriminately upon the main stem and Washington branch, as they are wanted on either road, although a separate account of repairs is kept for each.

There have been 26 new cattle cars recently contracted for, and 20 house cars advertised for, the former of which will be placed upon the road before the end of the year, and the latter early in the ensuing year:

The cost of maintaining this establishment of cars, during the past year, has been

For the main stem.....	\$52,200 53
Less increase in stock of materials during year.....	3,320 56
	<hr/> \$48,888 97
For the Washington branch..	\$7,625 89
More decrease in stock of materials during year.....	1,954 30—\$9,580 19
Total for both roads.....	<hr/> \$58,469 09

The increase upon the corresponding amounts expended in 1846 is \$17,279 55, for the main stem, and \$2,555 42 for the Washington branch, making a total increase of \$19,834 97. This increase is accounted for, in part, by the increase in the number of cars in motion, and of duty performed by them, and in part by the greater extent to which the rebuilding of old and worn out cars was carried during the past as compared with the preceding year—the cost of rebuilding in 1846 being estimated at \$17,250, and in 1847 at \$27,050; a difference of \$9,800 in the value of permanent improvements to the stock. This would leave an increase of but \$10,034 97 to be charged to augmented business and wear and tear.

The cost of repairs per ton per mile, for tonnage of all kinds, including materials and fuel for the company, has been upon the main stem, .180 of a cent, in 1847, against .196 of a cent in 1846, without crediting 1847 with the deduction just stated to be its due, and which, if made, would reduce from .180 to .144. So that the duty done has been performed at a cheaper rate, notwithstanding the increase in absolute cost. The reason of this is simply, that the cars have carried fuller loads, and have been more constantly employed, especially in the coal trade.

The cost of repairs this year, upon both main stem and Washington branch, has been 2.10 of a cent per ton per mile, for all tonnage, including material and fuel for the company, and, excluding them, 23-100 of a cent. The cost of repairs of the iron coal cars has not equalled one tenth of a cent per ton per mile of coal carried.

#### PASSENGER CARS.

The present establishment of passenger cars is as follows—those of the main stem and Washington branch being distinct, although they occasionally are used upon either road in emergencies.

**Main Stem.**—11 thoroughfare cars, 7 ladies' cars, 3 cars to run next the baggage car and with an apartment for smoking, 4 baggage cars, 1 car with sleeping births, 2 mail cars, and 2 cars for carrying emigrants at reduced fare; all of the preceding cars have 8 wheels, besides which, there are 4 six wheel package express cars, making 34 cars in all.

**Washington Branch.**—12 thoroughfare, 2 ladies', 3 baggage, and 1 mail car, all with 8 wheels, and 2 six wheel express cars, making 20 cars in all; and the total for both roads 54 cars. In addition to the above stock, proposals have been invited for furnishing 2 baggage and 2 mail cars, which will be upon the road before the end of the year, and will increase the stock to 58 passenger cars of all classes.

The cost of maintaining the passenger car establishment in repairs, for the past year, has been as follows:

For the main stem.....	\$36,094 24
To which must be added for decrease in value of materials for repairs.....	573 66
	\$36,667 90
For the Washington branch..	\$11,915 16
Add for decrease in value of materials for repairs.....	293 33
	\$12,207 49

Total for both roads.....\$38,875 39

The increase upon the corresponding amounts expended in 1846, is \$7,635 42 for the main stem, and the decrease, the fractional amount of 22 cents, for the Washington branch. The increase is due, in a degree, to the increase of work which has amounted to about 20 per cent., but mainly to the more extensive renewals of the cars during the past year. In 1846 about \$8000 was expended in their renovation, and in 1847 about \$12,000, which accounts for an augmented expenditure of some \$4,000, or more than one half of the difference stated. This allowance

being made, the cost of these repairs per passenger per mile has been almost identical this year with that of the previous one. In 1846 it was .178 of a cent per passenger, and in 1847 .210 of a cent, without the deduction just named, and .179 of a cent with it.

#### STATIONARY MACHINERY AND SHOPS.

This branch of the machinery department has been already spoken of, under the head of *depots and buildings*, in the preceding division of this report; being now placed under the care of the master of machinery, as belonging more peculiarly to his department, it will hereafter be treated of in immediate connection therewith. The stationary machinery put up within the last year, has consisted of the smith's forges, tools, lathes, and fixtures at the Cumberland and Harper's Ferry shops, necessary to perform the increasing repairs to the engines and cars required at those stations, and in carrying into effect the requirements of the new organization of the service, in reference to a more equal distribution of repairs among the five principal stations upon the line—Baltimore, Frederick, Harper's Ferry, Cumberland and Washington. When at each of these points there is a shop, at which duplicate parts shall be kept and all current repairs done, leaving the more extensive renewals of the machinery to be still made at Baltimore, much time and power, now expended in getting disabled engines and cars to the latter place, will be saved, to the advantage of the service.

#### SUMMARY.

The whole expense of maintaining the locomotives, passenger and burden cars during the year, ending September 30th, 1847, has been

Upon the main stem.....	\$152,543 28
Deduct for increase in value of materials.....	5,866 18

And the actual cost of maintenance will be.....\$146,577 10  
Which is 41,992 79 greater than that of the preceding year.

Upon the Washington branch, ..	\$29,658 44
Add for decrease in value of materials.....	3,281 15

And the true cost of maintenance will be.....\$32,939 59

Which is 2,174 73 greater than that of the preceding year.

#### 31.—CONDUCT OF THE TRANSPORTATION.

The activity of this department, to which the operations of the two already treated of are subsidiary, has, in all its branches, been far greater than in any former year. The unprecedented demand upon the seaboard for produce and provisions of all kinds, caused a flow of them from the interior, such as had never been previously witnessed, and all the means at the company's command of transporting this immense and sudden accession to the eastward tonnage of the road proved, for a time, inadequate to the performance of the service required. The passenger business kept pace with that of the freight, although, to its accommodation, the means at the company's disposal were at all times equal, though frequently put into the fullest requisition.—

The whole movement upon the road during the past year, by steam and horse power together, is exhibited as follows, in comparison with that of the previous year. The tonnage embraces the company's materials and fuel, as properly entering into the comparison.

Year	Passengers carried mile in both directions.	Tons carried one mile.			Total.
		Eastward.	Westward.	Both Directions.	
1847	12,835,856	91,668,244	520,546	452,944	27,204,065
1846	10,700,960	10,550,560	074,487	796,216	16,491,263
Inc.	2,134,896	11,108,684	446,008	343,728	10,712,802

We here perceive that the increase in the tonnage was 66 1/2 per cent., and in the passengers, 20 per cent., in the space of a single year. The increase in 1847, it will be seen, was chiefly in the eastward movement of the products of the interior, which was 100 per cent. of that of the previous year, while the westward movement was apparently but 10 per cent. in advance of that of 46, and the intermediate miscellaneous transportation in both directions was less than in that year.

The extreme inequality of the trade in the two directions, has thus made a much larger force of machinery necessary to perform the transportation, than if there had been a nearer approach to reciprocity, and, as the ratio has stood during the past year, four tons have come eastward to one that has gone westward so that three-fourths of the motive power and cars have been producing no immediate useful effect during their westward trips. The necessity of returning the cars from Baltimore, as soon as possible to the points at which they were to be loaded, made the greatest expedition necessary in the discharge of their loads at this end of the road, and the delays unavoidably attendant upon the distribution of the produce through the city by horse power, rendered this a very difficult task. Trains of empty cars were therefore sent out in the evening (the tonnage trains having previously started in the morning only) and by this means the cars were kept in quicker circulation. To effect these rapid movements in contrary directions, in harmony with those of the heavy passenger business upon a single track, provided with few passing places, much of it of inferior construction, producing frequent accidents to the trains, has not been a light labor. During the great press of the produce business throughout last winter and spring, accumulations at all the depots necessarily took place, and much complaint was made, in the absence of a correct knowledge of the real embarrassments against which this company (in common with all the proprietors of internal improvements throughout the country) were struggling. The want of suitable depot accommodations at the numerous points of reception along the line, has also added to the inconveniences under which the public and the company have labored during the times of pressure in the trade. The remedies for these several deficiencies in the means of conducting the transportation, must be found in the completion of

the measures in progress—to renovate and improve the old part of the road, to enlarge gradually the stock of engines and cars—to run the trains so as to keep up a more uniform movement, and to obtain relief from the delays attendant upon the distribution of the trade through the city.

## EXPENSES OF TRANSPORTATION.

**Main Stem.**—The charges against this department of the service amount to \$197,134 40 for the year ending September 30th, 1847. The corresponding expenditures for the previous year was \$146,057 91—showing an increase of \$51,076 49, from which must be taken the sum of \$7,723 50, to allow for an increase in the stock of fuel on hand, leaving the actual increase of expenses \$43,352 99, or 29 per cent. The increase of business done being 66½ per cent, in freight and 20 per cent in passengers, which, when the relative expense of the freight and passenger transportation is considered (two passengers costing about as much as a ton of freight) would be equivalent to an average increase of business of about 55 per cent.—so that the advance in the expenses falls 26 per cent. within that of the business done.

Year.	WAGES.						Increase in 1847.
	Superintending agents and clerks.	Enginemen and firemen.	Conductors and brakemen.	Depot labor.	Fuel—coal and wood.	Oil, grease and cotton waste.	
1847	12,776 16	38,932 49	10,246 09	9,630 27	52,836 42	15,439 50	197,134 40
1846	11,173 60	28,632 38	13,971 87	8,700 38	37,687 82	9,757 62	146,057 91
Increase	\$1,602 56	\$10,300 11	\$6,274 22	\$930 89	\$15,048 60	\$5,681 88	\$51,076 49
1847							197,134 40
1846							146,057 91
Increase							51,076 49
Total expenses of transportation.							197,134 40
							146,057 91
Increase							51,076 49

An examination of the above synopsis of the transportation expenses of the two years will show that in all instances except that of

oil, the ratio of increase in expense is far within that of the increase in the business—The prices of oil and grease, the past year, have been 15 per cent higher than the year before. Hence the exception against these items.

**Washington Branch.**—The transportation of this road were, during the past year, \$29,364 45, from which should be deducted a credit of \$525 for increased stock of fuel—leaving \$28,839 45 as the actual outlay in this department, against \$26,546 59, the amount of the preceding year, and showing an advance upon that of the latter of \$2,292 86. This increase is due, altogether, to the increase in the prices of fire wood and oil, which has added to the expense of those articles, at least the amount of the difference stated.

Your attention is pointed to the item in the above table showing the cost of maintaining the horse power in the city. There are employed in the streets and at Mount Clare, the average number of 105 horses—of which 73 belong to the tonnage and 32 to the passenger business—the severity of the duty to which they are subjected is evidenced by the fact that an average of 12 of the former and 4 of the latter are always in the list of disabled; the wear and tear of the tonnage horses being 33½ per cent the greatest. The expense of this power has increased in a much slower proportion than the duty performed. Of the whole expense of \$35,517 78, the cost of carrying passengers is \$11,511 93, and of tonnage of \$24,005 85. In 1846, it was for passengers \$8,660 02, and tonnage \$21,534 38. Increase this year, for passengers \$2,851 91, and for tonnage \$2,471 47. The number of passengers carried one mile this year, was 180,273—last year, 130,000; increase 50,273 or 38½ per cent; while the increase in the expense was but 33 per cent.

The number of tons carried one mile this year was 317,133 (besides materials, etc., for the company)—last year 156,573; increase 160,560, or 103 per cent, while the increase of expense would appear to be but 11½ per cent. The cost per passenger per mile, in the year just closed, was 6 4/10 cents—and per ton per mile 7 6/10 cents—not including the company's materials, which are estimated as having amounted to 18,572 tons hauled one mile.

The expenses of transportation upon the *Washington branch* are necessarily much less subject to variation than those of the main stem. The chief business of the road, the carrying of passengers, is indeed very fluctuating, and there is no regular progressive increase except in that of tonnage, which is steadily, though slowly advancing. The number of trains run remains the same from year to year, and the cost of running them is not very materially effected, by the loads they carry.

Upon a general review of the operations and expenses of the transportation department during the past year, it must be apparent, that having reference to the results which its administration has produced, it has been conducted with energy and economy.

## 4th.—REVENUE, EXPENSES AND TRADE.

## Main Stem.

1. **Revenue.**—The receipts from the several sources are as follows, for the year ending September 30th, 1847; and those of the previous fiscal year are placed by the side of them, that the relations of each item may be seen.

	1846.	1847.	Increase.
Passengers in Main Stem trains.....	361,546 24	361,546 24	28,008 73
Passengers in Washington branch trains on 8 miles of main stem.....	43,966 90	43,966 90	7,133 35
Tonnage in Main Stem trains.....	\$403,812 44	\$403,812 44	\$35,232 09
Do. in Washington branch trains as above.....	628,923 51	628,923 51	183,757 51
Total passengers carried.....	18,986 97	18,986 97	696 79
Total tonnage transported.....	\$647,509 48	\$647,509 48	\$184,454 30
Mail transportation in Main Stem train.....	40,664 00	40,664 00	
Mail transportation Washington branch train as above.....	2,544 00	2,544 00	
Total mail transportation.....	\$43,208 00	\$43,208 00	
For use of cars upon Winchester and Potomac Railroad.....	3,922 91	3,922 91	132 15
Toll collected at Harper's Ferry viaduct.....	1,983 75	1,983 75	432 69
Rent of Pratt street depot to Philadelphia Railroad Company.....	1,500 00	1,500 00	
Total revenue from all sources.....	\$1,101,936 58	\$1,101,936 58	\$220,251 05

The revenue is thus seen to have reached the sum of \$1,101,936 58—exceeding that of the previous year \$220,251 05, or 25 per cent. of the latter.

Of this increase, five-sixths is due to the tonnage, and but one-sixth to the passenger business.

The increase in the revenue from tonnage has been mainly realized from produce, live stock and coal, transported eastwardly.

The increase of receipts from passengers has been chiefly upon the through travel, in connection with the stage lines west of Cumberland.

**Expenses.**—The expense of working the road is summed up as follows, under the heads already treated of, adding the item of "general expenses," not embraced under any one of them, and consisting of losses by fire and other accidents, salaries, house rent, law expenses, insurance, taxes and other incidentals:

1. Maintenance of road.....	\$215,046 64
2. Maintenance of machinery.....	146,577 10
3. Conduct of transportation.....	189,410 90
4. General expenses.....	14,877 08

Making an aggregate of.....\$565,911 72

The total expenses charged upon the books are \$590,828 98. The difference of \$29,917 26 is the increase in the estimated value of materials and fuel on hand, which has taken place during the year. A careful account is taken of the stock of all kinds at the close of each year, and thus the comparison is carried on from year to year, which is manifestly essential to a correct exhibit of the

absolute as well as relative expense of each year's operations.

The gross receipts of the year having been \$1,101,936 58, and the actual expenses \$565,911 72, the net earnings of the road were, consequently, \$536,024 86, which is  $7\frac{1}{2}$  per cent. upon the capital of \$7,000,000.

The expenses have been  $51\frac{1}{2}$  per cent. of the receipts, taking the account of each as it stands above. But if the part of the expenses consisting of permanent improvements, independent of allowances for depreciation, and, therefore, properly chargeable to capital, and amounting, on all accounts, to at least \$50,000, should be deducted from the apparent current expenses, the latter would be reduced to \$515,911 72,—forming but 46 8 10 per cent. of the receipts of the year.

#### WASHINGTON BRANCH.

The receipts of this road, for the year ending September 30th, 1837, were as follows:

From passengers.....	\$159,402 05
From tonnage.....	48,706 62
From mail.....	10,176 00

Total receipts from all sources,....\$218,284 67

The expenses, under the heads above treated of, are summed up as follows:

1. Maintenance of road,....	\$21,361 21
2. Maintenance of machinery 32,939 59	
3. Conduct of transportation..	28,839 43
4. General expenses.....	8,875 87
	92,016 19

Leaving an excess of receipts over expenditures of.....\$126,268 55

To show the real net revenue, the bonus paid to the state and amounting this year to \$39,528 30 must be deducted, which leaves but \$86,740 25 as the real profits of the work. This tax is not however in fact any part of the cost of working the road, but is an incidental adjunct to the improvement, and therefore in computing, professionally, the value of the Washington road as a line of railway it should be left out of view. Comparing then the receipts and expenses apart from this necessary, we see that the latter constitute but 42 per cent. of the former, and that the excess of the one over the other would yield  $7\frac{1}{2}$  per cent. upon the capital of \$1,650,000, invested in the work.

The excess of receipts over all expenses, including the state tax, shown by the account books, and exhibited in the statement of the treasurer is \$69,607 56, being \$2,867 31 more than the amount of \$86,740 25 above stated. The difference being due to the estimated decrease in the value of stock of materials, etc., of which the books do not take notice.

#### TRADE OF THE ROAD.

##### Main Stem.

The general movement of the trade of the road is indicated in the preceding statements, which show the tonnage in either direction, and that for each ton going westward there have been four coming eastward, during the past year. Of the eastward tonnage, the principal share has been contributed by flour and coal, the amounts of which, arriving in Baltimore, are shown as follows, as well as the other freight, classified under a few prominent heads.

Rec'd at Baltimore during the year.	Barrels.	Tons.
Flour from all points of the road.	579,870 1	62,599
Coal from Cumberland.....		50,259
Grain from all points.....		6,693
Live stock from all points.....		8,204
Provisions from all points.....		3,824
Meal, etc., from all points.....		1,967
Lard and butter from all points..		1,480
Whiskey from all points.....		700
Tobacco from all points.....	4,130 hds.	1,700
Iron from all points.....		8,855
Granite and soapstone.....		5,894
All other tonnage.....		6,282

Total tons of commodities of all kinds...158,466

This tonnage forms but that part of the eastward movement which reached Baltimore constituting however, of course, almost the whole amount of the trade eastward. Of the westward tonnage no classification has heretofore been made upon the company's records, and the keeping of a full and satisfactory one, would be attended with a good deal of trouble. It is intended however, to make such a division of the tonnage going westward as will show some of the chief articles returned to the interior, for the products sent by it to the seaboard.

In order to permit a comparison of the eastward trade over the road, in the principal staples during the successive years, since the opening of the road; a table is annexed, lettered F, containing a condensed exhibit of the tonnage arriving in Baltimore since the year 1831, by the Baltimore and Ohio Railroad. In reference to the coal trade, it may be observed, that the number of cars built for that trade, and not suited for other transportation, is sufficient for the delivery in Baltimore of 90,000 tons per annum, besides supplying the local demand of the line, which is considerable. It may be expected, therefore, that during the coming year nearly twice as much Cumberland coal will be brought to Baltimore as reached it in the year just expired. The clear profit upon the conveyance of this amount of coal will be not less than from \$50,000 to \$60,000, and were the company in a position to increase its machinery, for the conveyance of this branch of their trade, to the extent desired and urged by the parties engaged in it, the revenue from this source might be largely multiplied. Until, however, the means of reaching tide water with this trade is facilitated, by the proposed extension to the south side of the harbor, its further increase is hardly to be desired, either on the part of the company or those in the business.

It is stated above that the principal increase in passengers has been in the class of through travellers, to and from points east and west of Baltimore and Cumberland. The number of passengers carried in the cars during the past year ..... 288,674 1/2  
While the number for the previous year was ..... 280,264 1/2

So that the increase was ..... 8,410

The number of passengers carried one mile this year, as before stated, 12,835,856, and last year 10,700,960—the increase being 2,134,896. The number of miles travelled by each of the additional passengers of the present year must then have averaged 254,

the one half of which for each direction east and west is 127 miles, but fifty miles short of the whole length of the road. The number of passengers carried in each direction between Baltimore and Philadelphia, in the east, and Wheeling and Pittsburg on the west, is as follows:

Westward—Philadelphia to Pittsburg..	8,061
Baltimore to do.....	5,533
Total to Pittsburg.....	13,594
Philadelphia to Wheeling..	4,050
Baltimore to do.....	4,372
Total to Wheeling..	8,422
Total through passengers westward..	22,016
Eastward—Pittsburg to Philadelphia..	6,977
Do. to Baltimore.....	3,219
Total from Pittsburg..	10,196
Wheeling to Philadelphia..	5,798
Do. to Baltimore.....	3,379
Total from Wheeling..	9,177
Total through passengers eastward..	19,373
Total through passengers eastward and westward.....	41,389

From this statement it would then appear, that of the whole number of 41,389 through passengers 16,503 have started from or stopped at Baltimore; and 24,886 have come from or gone to Philadelphia. The inferences to be drawn from these facts must be accompanied by with proper allowances for the travellers, who although starting from or bound to Philadelphia, halt in Baltimore, and for those doing the same by Baltimore have come from or are going to Philadelphia.—The facts may, however, be useful in showing the course of travel over the line.

The revenue derived from western passengers has been \$194,502—being 48 per cent. of the entire receipts from passengers during the year. Analogous to the class of western passengers over the main stem is that of southern passengers over the Washington branch, who also contribute to the travel and revenue of the former.

Their number during the year just ended was,  
Southwardly.....8,957  
Northwardly.....8,081

Making a total in both directions of.....17,038  
And yielding a clear revenue to the main stem of \$4,361 60. The remaining travel upon the Washington branch gives a clear revenue to the main stem of 30,323 68—From the local travel of the main road, therefore, there has been derived a revenue of 174,625 16; the whole revenue from passengers, amounting as before stated to 403,812 44.

#### WASHINGTON BRANCH.

**Tonnage.**—The trade upon this road, in the direction of Washington, consists almost entirely of merchandise going to that city. Limestone, to the extent of some 3000 tons per annum, is conveyed from Baltimore to the Annapolis junction, for the Patuxent iron works. In the direction of Baltimore the tonnage is principally iron ore and iron, from the line of the road. The Laurel Factory is a contributor to the trade in both directions.

The number of tons drawn one mile on this road, during the past year, was, eastward—

ly. 551,815—and westwardly 494,200—total 1,046,015 tons one mile, exclusive of materials for the company, amounting to 48,807 tons; and making an aggregate of 1,094,822 tons. The freight business upon this road must continue steadily to increase until it bears a much larger proportion to its passenger business than at present. The revenue from freight in 1847, is \$1,502 08 greater than in 1846.

**Passengers.**—The number of passengers carried upon this road during the past year, has been 151,683 for various distances; equivalent to the conveyance of 3,834,701, a distance of one mile. Of these the through southern passengers numbered 17,038 over the whole road—equal to 528,178, a distance of one mile, and constituting about 1-7 of the whole number; showing that it is very mainly the local travel which sustains this road. The revenue from passengers in 1847, is \$10,169 85 less than that of 1846; the national fair, held in May of that year, having itself yielded a revenue of about \$10,000,—and the occurrence of such extraordinary occasions of travel upon this road must always render its income from passengers unsteady.

Having thus gone over the several subjects indicated in the commencement of this report, I conclude what seems necessary to be said in regard to the "working of the road" with a reference to the accompanying tabular statement, lettered G, in which the several results above set forth are exhibited in a condensed form, with such other statements and deductions as seem suitable to be presented. This table will form a continuation, in a somewhat different form, of the series of statements of the same kind heretofore attached to the annual report, and prepared by the officer formerly in charge of the maintenance of the road and machinery. A more condensed table, lettered H, and showing the same results on the Washington branch, is also appended.

A statement of the business, revenue, expenses and dividends of the company since the opening of the road in 1830, is also appended, lettered I, from which will be observed the progressive increase of its extent, operations and income. It will be seen that the aggregate profits upon the working of the road have amounted to \$3,037,617, of which \$1,089,138 have been paid in dividends to the stockholders, and \$1,948,509 has been reinvested in the work, in permanent additions and improvements, which have increased its value fully to that amount; so that the nominal capital of \$7,000,000 does not represent truly the worth of the property of the company, which has, in fact, cost the sum of \$8,498,509, and is fully worth that sum at this time, and prospectively much more. Of the details of this reinvestment, it is not now necessary to state more than that they consist of what has been paid for iron rails, for the road west of Harper's Ferry, for locomotive engines and cars, for the new track east of Harper's Ferry, and for numerous substantial and highly valuable improvements in bridges, depot buildings, work shops, water stations, and other parts or appurtenances of the road,

all of which remain as visible and tangible evidences that the portion of the income not directly given to the stockholders, has not been squandered and sunk, but is existing, and in truth, if not in appearance, yielding them interest. The comparison with the operations of other roads promised at the outset of this report I have thought it best to present in a condensed form in the statement annexed, lettered K, and an examination of which cannot fail to produce favorable impressions of the manner in which the Baltimore and Ohio Railroad, with all the disadvantages under which it is admitted to have labored, has been administered.

## II. The Reconstruction and Improvement of the old Road.

1. *The Laying of the new Track.*—It has been already stated under the head of "maintenance of road," that of the new track, by which the old plate rail is being replaced, there had been 41 miles laid upon the 1st of this October; thirty of which were laid last season, and eleven during the present. There remains to be laid twenty miles of the track authorized this year, and for which all the materials but the iron rails are fully provided. The rails are furnished by the Covington company at the Avalon works, upon the line of the road, where the delivery is made with the utmost convenience. The iron is of excellent quality and well rolled, and is placed in the track as fast as it is manufactured.

The part of the new track laid this year is in excellent adjustment, having been carefully put down upon a very firm foundation, for which the old stone track, (the sills of which are still mostly in their places,) has in part been made available, as a substitute for the under sill of timber. The ballasted horse path used in the early times of the work, when animal power was the only means of locomotion, is now also yielding a return for the expense of its construction by affording an excellent bed for the new structure.

2. *The Alterations in the Location of the Road bed.*—These improvements in the line, which were authorized and put under contract upon very favorable terms some weeks since, are, in part, progressing, although some delay has been experienced in procuring from the land owners the right to make them.—These difficulties will, it is hoped, be shortly removed, and this important work be permitted to progress without interruption, so as to be completed in the spring, and receive the new track which is to be laid upon them.

## III. The Extension of the Road.

1. *West of Cumberland.*—In June last, I received your instructions to locate the line of the road as far westward as the Maryland and Virginia state line, on the southern route towards the Ohio. Three parties of engineers were accordingly organized, one of which went into the field on the 1st of July, another about the middle of that month, and the third about the 1st of August. The first has been engaged between Cumberland and Westernport, 27 miles up the valley of the North branch, and has made careful locations of several lines in the town of Cumberland, and

extended a line up the Potomac to Fort hill, 13 miles distant. This party has also traced with care, several lines from points upon the finished road as far east of Cumberland as the mouth of Patterson's creek, 8 miles below across the Knoby mountain, with a view to cutting off the great bend of the river at Cumberland. A saving of ten miles of distance may be effected by the best of these routes. The relative grades, curves and cost, are not yet definitely known. This party has located a distance fully equal to that of the whole line to Westernport, and, having now united the two routes east of Fort hill, will continue the staking out of the route above that point, and complete it early in the coming winter.

The second party has been employed in the location between Westernport and the Backbone or main summit, and has had a very difficult line to run upon the mountain slopes of the very rugged ravines of Crabtree creek and Savage river. The progress of this party has been, consequently, very slow; and it has been further retarded by the prevalence of the almost perpetual rains of that humid region. The chief difficulties of this section of the route are, however, now overcome, and it is hoped that its preparation for contract may also be completed early in the winter.

The third party has been engaged upon the easy and beautiful part of the route lying westward from the summit through the glades and has completed its location, for a distance of upwards of 15 miles, to the State line, and is now extending it in Virginia to the head of Snowy creek, whence the descent to the valley of Cheat river commences.

The rigorous winter which prevails in that elevated district will not permit the advantageous prosecution of the surveys later in the season than the end of the present year, at which time it is believed that about sixty-five miles of the route from Cumberland west, will be prepared for contract.

The measures necessary to secure the right of way from the land owners have also been in active progress, under the management of the company's counsel in Alleghany county.

2. *East of Mount Clare.*—The new surveys directed by the recent order of the board in reference to the extension to tide water, are now being made, and their results will be reported so soon as the necessary lines can be run and estimates prepared.

In closing this report, I must express my regret that it has extended to so great a length; but upon reviewing what has been written, I have not been able to see in what particulars it could be curtailed, without impairing its value as an exhibit of the operations of the road, to which I have endeavored to give a form and arrangement that might make it useful for the present information of those interested in the work, as well as for future reference in the preparation of similar documents hereafter.

I am, sir, respectfully,  
Your obed't serv't,  
BENJ. H. LATROBE,  
Chief Engineer, acting as Gen. Supt.

**RAILROAD IRON.—500 TONS OF THE** latest and most approved pattern of T Rail—weighing about 63 lbs. per yard, shipped from England in October, and shortly expected. For sale by **BOORMAN, JOHNSTON & CO.,** 119 Greenwich St., New York.

**DEAN, PACKARD & MILLS,**

MANUFACTURERS OF ALL KINDS OF

**RAILROAD CARS,**

SUCH AS

PASSENGER, FREIGHT AND CRANK CARS,

— ALSO —

SNOW PLOUGHS AND ENGINE TENDERS

OF VARIOUS KINDS.

CAR WHEELS and AXLES fitted and furnished

at short notice; also, STEEL SPRINGS

of various kinds; and

SHAFTING FOR FACTORIES.

The above may be had at order at our Car Factory,

**TO RAILROAD COMPANIES AND BUILDERS OF MARINE AND LOCOMOTIVE ENGINES AND BOILERS.**

**PASCAL IRON WORKS.**

**WELDED WROUGHT IRON TUBES**

From 4 inches to 4 in calibre and 2 to 32 feet long, capable of sustaining pressure from 400 to 2500 lbs. per square inch, with Stop Cocks, T, L, and other fixtures to suit, fitting together, with screw joints, suitable for STEAM, WATER, GAS, and for LOCOMOTIVE and other STEAM BOILER FLUES.

Manufactured and for sale by

**MORRIS, TASKER & MORRIS.**

Warehouse S. E. Corner of Third & Walnut Streets, PHILADELPHIA.

**RAILROAD IRON.—THE NEW JERSEY** Iron Company, Boonton, N. J., are now making Railroad Bars, and are prepared to execute orders for any required pattern. Apply to

**FULLER & BROWN, Agents.**

No. 139 Greenwich, corner of Cedar street.

June 1, 1847.

10f

**CHILLED RAILROAD WHEELS.—THE** undersigned are now prepared to manufacture their Improved Corrugated Car Wheels, or Wheels with any form of Spokes or Disks, by a new process which prevents all strain on the metal, such as is produced in all other chilled wheels, by the manner of casting and cooling. By this new method of manufacture, the hubs of all kinds of wheels may be made whole—that is, without dividing them into sections—thus rendering the expense of banding unnecessary; and the wheels subjected to this process will be much stronger than those of the same size and weight, when made in the ordinary way.

**A. WHITNEY & SON,**

Willow St. below 13th,

Nov. 10, 1847. [tf.] Philadelphia, Penna.

**LAP—WELDED WROUGHT IRON TUBES**

FOR

**TUBULAR BOILERS,**

FROM 1 1-4 TO 6 INCHES DIAMETER,

and

ANY LENGTH, NOT EXCEEDING 17 FEET.

These Tubes are of the same quality and manufacture as those so extensively used in England, Scotland, France and Germany, for Locomotive, Marine and other Steam Engine Boilers.

**THOMAS PROSSER,**

Patentee.

36 Plau street, New York.

**PATENT RAILROAD, SHIP AND BOAT** Spikes. The Troy Iron and Nail Factory keeps constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years' successful operation, and now almost universal use in the United States (as well as England, where the subscriber obtained a patent) are found superior to any ever offered in market.

Railroad companies may be supplied with Spikes having countersink heads suitable to holes in iron rails, to any amount and on short notice. Almost all the railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. York will be punctually attended to.

**HENRY BURDEN, Agent.**

Spikes are kept for sale, at Factory Prices, by I. & J. Townsend, Albany, and the principal iron merchants in Albany and Troy; J. I. Brower, 222 Water St., New York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

•• Railroad Companies would do well to forward their orders as early as practicable, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand.

ja45

**MANUFACTURE OF PATENT WIRE**

Rope and Cables for Inclined Planes, Standing Ship Rigging, Mines, Cranes, Tillers etc., by **JOHN A. ROEBLING, Civil Engineer,** Pittsburgh, Pa.

These Ropes are in successful operation on the planes of the Portage Railroad in Pennsylvania, on the Public Slips, on Ferries and in Mines. The first rope put upon Plane No. 3, Portage Railroad, has now run 4 seasons, and is still in good condition.

92v11y

**FRENCH AND BAIRD'S PATENT SPARK ARRESTER.**

**TO THOSE INTERESTED IN** Railroads, Railroad Directors and Managers are respectfully invited to examine an improved Spark Arrester recently patented by the undersigned.

Our improved Spark Arresters have been extensively used during the last year on both passenger & freight engines, and have been brought to such a state of perfection that no annoyance from sparks or dust from the chimney of engines on which they are used is experienced.

These Arresters are constructed on an entirely different principle from any heretofore offered to the public. The form is such that a rotary motion is imparted to the heated air, smoke and sparks passing through the chimney, and by the centrifugal force thus acquired by the sparks and dust they are separated from the smoke and steam, and thrown into an outer chamber of the chimney through openings near its top, from whence they fall by their own gravity to the bottom of this chamber; the smoke and steam passing off at the top of the chimney, through a capacious and unobstructed passage, thus arresting the sparks without impairing the power of the engine by diminishing the draught or activity of the fire in the furnace.

These chimneys and arresters are simple, durable and neat in appearance. They are now in use on the following roads, to the managers and other officers of which we are at liberty to refer those who may desire to purchase or obtain further information in regard to their merits:

R. L. Stevens, President Camden and Amboy Railroad Company; Richard Peters, Superintendent Georgia Railroad, Augusta, Ga.; G. A. Nicolls, Superintendent Philadelphia, Reading and Pottsville Railroad, Reading, Pa.; W. E. Morris, President Philadelphia, Germantown and Norristown Railroad Company, Philadelphia; E. B. Dudley, President W. and R. Railroad Company, Wilmington, N. C.; Col. James Gadsden, President S. C. and C. Railroad Company, Charleston, S. C.; W. C. Walker, Agent Vicksburg and Jackson Railroad, Vicksburg, Miss.; R. S. Van Rensselaer, Engineer and Sup't Hartford and New Haven Railroad; W. R. M'Kee, Sup't Lexington and Ohio Railroad, Lexington, Ky.; T. L. Smith, Sup't New Jersey Railroad Trans. Co.; J. Elliott, Sup't Motive Power Philadelphia and Wilmington Railroad, Wilmington, Del.; J. O. Stems, Sup't Elizabethtown and Somerville Railroad; R. R. Cuyler, President Central Railroad Company, Savannah, Ga.; J. D. Gray, Sup't Macon Railroad, Macon, Ga.; J. H. Cleveland, Sup't Southern Railroad, Monroe, Mich.; M. F. Chittenden, Sup't M. P. Central Railroad, Detroit, Mich.; G. B. Fisk, President Long Island Railroad, Brooklyn.

Orders for these Chimneys and Arresters, addressed to the subscribers, care Messrs. Baldwin & Whitney, of this city or to Hinckly & Drury, Boston, will be promptly executed. **FRENCH & BAIRD,**

N. B.—The subscribers will dispose of single rights, or rights for one or more States, on reasonable terms.

•• The letters in the figures refer to the article given in the Journal of June, 1844.

ja45

**PATENT HAMMERED RAILROAD, SHIP and Boat Spikes.** The Albany Iron and Nail Works have always on hand, of their own manufacture, a large assortment of Railroad, Ship and Boat Spikes, from 2 to 12 inches in length, and of any form of head. From the excellence of the material always used in their manufacture, and their very general use for railroads and other purposes in this country, the manufacturers have no hesitation in warranting them fully equal to the best spikes in market, both as to quality and appearance. All orders addressed to the subscriber at the works, will be promptly executed. **JOHN F. WINSLOW, Agent.**

Albany Iron and Nail Works, Troy, N. Y. The above spikes may be had at factory prices, of Erastus Corning & Co., Albany; Hart & Merriitt, New York; J. H. Whitney, do.; E. J. Eting, Philadelphia; Wm. E. Coffin & Co. Boston. ja45

**MACHINE WORKS OF ROGERS,** Ketchum & Grosvenor, Paterson, N. J. The undersigned receive orders for the following articles, manufactured by them of the most superior description in every particular. Their works being extensive and the number of hands employed being large, they are enabled to execute both large and small orders with promptness and despatch.

Railroad Work.

Locomotive steam engines and tenders; Driving and other locomotive wheels, axles, springs & flange tires; car wheels of cast iron, from a variety of patterns, and chills; car wheels of cast iron with wrought tires; axles of best American refined iron; springs; boxes and bolts for cars.

Cotton, Wool and Flax Machinery of all descriptions and of the most improved patterns, style and workmanship.

Mill gearing and Millwright work generally; hydraulic and other presses; press screws; callenders; lathes and tools of all kinds; iron and brass castings of all descriptions.

**ROGERS, KETCHUM & GROSVENOR,** Paterson, N. J., or 60 Wall street, N. York.

# DAVENPORT & BRIDGES'

CAR WORKS, CAMBRIDGEPORT, MASS.

Manufacture to Order, Passenger and Freight Cars of every description, and of the most improved pattern; also furnish Snow Ploughs and Chilled Wheels of any pattern and size. Forged Axles, Springs, Boxes and Bolts for Cars at the lowest prices.

All orders punctually executed and forwarded to any part of the country.

Our Works are within fifteen minutes ride from State street, Boston—Omnibuses pass every fifteen minutes.

## THE HERRON RAILWAY TRACK,

As seen stripped of the top ballasting

A GOLD MEDAL AWARDED THE INVENTOR BY THE AMERICAN INSTITUTE.

**THE UNDERSIGNED RESPECTFULLY** invites the attention of Engineers, and Railroad Companies, to some highly important improvements he has recently made in the Herron system of Railway structure. These improvements enable him to effect a very large reduction in the quantity of Timber, and cost of construction, without impairing the strength of the Track, or its powers of resisting frost, while they secure additional features of excellence in the Drainage and facility of making Repairs.

The above cut represents the "Herron Track" as it is laid on the Philadelphia and Reading, and on the Baltimore and Susquehanna Railroads. The intersection of the sills of the trellys are 5 feet from centre to centre, while in the new construction they are only 2½ feet. This renders the string piece unnecessary, thus removing the only objectionable feature found in the Track.

The result of experience has proved that all Tracks constructed with longitudinal timbers, such as mud sills, and more especially, the continuous bearing string pieces retain the rain water that falls between the Rails, which, being thus confined, settles along those timbers, and accumulating in quantity flows rapidly along them on the descending grades, washing out the earth from under the timber, and frequently causing large breaches in the embankments of the road. Whereas all water intercepted by the oblique sills of the trellys, is discharged immediately into the side ditches.

In the 5 foot plan, the Track occupies a Road bed nearly 11 feet wide, while the new construction takes

but 8 feet; the timber being more concentrated under the Rails. A block of hard wood, about 2 feet long and 15 inches wide, is introduced into a square of the trellys for the purpose of giving an additional, and effectual support to the joints of the Rails, which rest upon it. Should these joint blocks become chafed and worn by the working, and imbedding of the chairs, as is now the case on all Railroads, they can be readily replaced without any derangement of the timbers less liable to wear.

The following is a general estimate of its cost near the seaboard. In the interior it will be considerably less.

ESTIMATE OF THE PROBABLE COST OF ONE MILE.	
4,224 Timbers, 11 ft. long, 3 x 6 inches =	
68,696 ft. b.m., at \$10 =	\$686 96
587 Oak joint blocks 2 ft. x 3 x 15 in. =	
4,403 ft. b.m., at \$13 =	57 24
13,000 Spikes = 2,250 lbs. at 4½ cts. =	101 25
Workmanship free of patent charge =	600 00

Cost of one mile including the laying of the Rail.....\$1,445 45

He has made other important improvements, which will be shown in properly proportioned models, that give a much better idea of the great strength of the Track than a drawing will do.

Sales of the Patent right to all the distant States will be made on liberal terms.

JAMES HERRON.  
Civil Engineer and Patentee.  
No. 277 South Tenth St., Philadelphia.

ENGINEERS' AND SURVEYERS'  
INSTRUMENTS MADE BY  
EDMUND DRAPER,  
Surviving partner of  
STANCLIFFE & DRAPER.

No 23 Pear street,  
1y10 near Third,  
below Walnut,  
Philadelphia.

THE SUBSCRIBER has on hand a good assortment of his best Leveling and Surveying Instruments, among them his improved Compass for taking angles without the needle—also Bells, suitable for Churches, Railroad Depots, etc.

ANDREW MENEELY.  
West Troy, May 12, 1847. 1y•21

**PIG AND BLOOM IRON.**—THE SUBSCRIBERS are agents for the sale of numerous brands of Charcoal and Anthracite Pig Iron, suitable for Machinery, Railroad Wheels, Chains, Hollowware, etc. Also several brands of the best Puddling Iron, Juniatta Blooms suitable for Wire, Boiler Plate, Axe Iron, Shovels, etc. The attention of those engaged in the manufacture of Iron is solicited by

A. WRIGHT & NEPHEW,  
12½ Vine St. Wharf, Philadelphia.

**RAILROAD IRON.**—THE "MONTGOMERY" Iron Company, Danville, Pa., is prepared to execute orders for the heavy Rail Bars of any pattern now in use, in this country or in Europe, and equal in every respect in point of quality. Apply to  
MURDOCK, LEAVITT & CO.,  
Agents.  
77 Pine St., New York.

1y48

**LAWRENCE'S ROSENDALE HYDRAULIC CEMENT.** This cement is warranted equal to any manufactured in this country, and has been pronounced superior to Francis' "Roman." Its value for Aqueducts, Locks, Bridges, Floors and all Masonry exposed to dampness, is well known, as it sets immediately under water, and increases in solidity for years.

For sale in lots to suit purchasers, in tight papered barrels, by  
JOHN W. LAWRENCE,  
142 Front street, New York.

Orders for the above will be received and promptly attended to at this office. 32 17

**RAILROAD IRON AND LOCOMOTIVE**  
Tyres imported to order and constantly on hand by  
A. & G. RALSTON  
Mar. 20½ 4 South Front St., Philadelphia.

**THE NEWCASTLE MANUFACTURING** Company continue to furnish at the Works, situated in the town of Newcastle, Del., Locomotive and other steam engines, Jack screws, Wrought iron work and Brass and Iron castings, of all kinds connected with Steamboats, Railroads, etc.; Mill Gearing of every description; Cast wheels (chilled) of any pattern and size, with Axles fitted, also with wrought tires, Springs, Boxes and bolts for Cars; Driving and other wheels for Locomotives.

The works being on an extensive scale, all orders will be executed with promptness and despatch. Communications addressed to Mr. William H. Dobbs, Superintendent, will meet with immediate attention.

ANDREW C. GRAY,  
a45 President of the Newcastle Manuf. Co.

**LOCOMOTIVE AND CAR AXLES.** The Subscribers are now prepared to receive orders for the well known and approved Reading Locomotive and Car Axles—drawn to any required pattern from Bloom Iron only. Address

SAM'L KIMBER & CO.,  
Willow Street Wharf,  
Philadelphia, Pa.

**RAY'S EQUALIZING RAILWAY TRUCK.—THE SUBSCRIBER** having recently formed a business connection in the City of New

York, expressly for the manufacture of the newly patented and highly approved Railroad Truck of Mr. Fowler M. Ray, is ready to receive orders for building the same, from Railroad Companies and Car Builders in the United States, and elsewhere.

The above Truck has now been in use from one to two years on several roads a sufficient length of time to test its availability, and other good qualities, and to satisfy those who have used it, as may be seen by reference to the certificates which follow this notice.

There have been several improvements lately introduced upon the Truck, such as additional springs in the bolster of passenger cars, making them delightful riding cars—adapting it to tenders, trucks forward of the locomotive, and freight cars, which, with its original good qualities, make it in all respects the most desirable truck now offered to the public.

Orders for the above, will, for the present, be executed at the New York Screw Mill, corner 33d street and 3d avenue, (late P. Cooper's rolling mills) and at the Steam Engine Shop of T. F. Secor & Co., foot of 9th street, East

**ENGLISH PATENT WIRE ROPES—FOR THE USE OF MINES, RAILWAYS, ETC.—** for sale or imported to order by the subscriber.

These Ropes are manufactured on an entirely different principle from any other, and are now almost exclusively used in the collieries and on the railways in Great Britain, where they are considered to be greatly superior to hempen ones, or iron chains, as regards safety, durability and economy. The plan upon which they are made effectually secures them from corrosion in the interior, as well as the exterior of the rope, and gives a greater compactness and elasticity than is found in any other manufacture.

Many of these ropes have been in constant operation in the different mines in England, and on the Blackwall and other inclined planes, for three and four years, and are still in good condition.

They have been applied to almost every purpose for which hempen ropes have been used—mines, heavy cranes, standing rigging, window cords, lightning conductors, signal halyards, tiller ropes, etc. Reference is made to the annexed statement for the relative strength and size. Testimonials from the most eminent engineers in England can be shown as to their efficiency, and any additional information required respecting the different descriptions and application will be given by

**ALFRED L. KEMP,**  
75 Broad street, New York, sole agent in the United States.

*Statement of Trial made at the Woolwich Royal Dock Yard, of the Patent Wire Ropes, as compared with Hempen Ropes and Iron Chains of the same strength.—October, 1841.*

**RAILROAD SCALES.—THE ATTENTION** of Railroad Companies is particularly requested to Ellicott's Scales, made for weighing loaded cars in trains, or singly, they have been the inventors, and the first to make platform scales in the United States; proposing that an experience of 20 years has given a knowledge and superior advantage in the business.

The levers of our scales are made of wrought iron, all the bearers and fulcrums are made of the best cast steel, laid on blocks of granite, extending across the pit, the upper part of the scale only being made of wood. E. Ellicott has made the largest Railroad Scale in the world, its extreme length was one hundred and twenty feet, capable of weighing ten loaded cars at a single draft. It was put on the Mine Hill and Schuylkill Haven Railroad.

We are prepared to make scales of any size to weigh from five pounds to two hundred tons.

**ELLICOTT & ABBOTT.**

Factory, 9th street, near Coates, cor. Melon st.

Office, No. 3 North 5th street,

1y25

Philadelphia, Pa.

**NICOLL'S PATENT SAFETY SWITCH** for Railroad Turnouts. This invention, for some time in successful operation on one of the principal railroads in the country, effectually prevents engines and their trains from running off the track at a switch, left wrong by accident or design.

It acts independently of the main track rails, being laid down, or removed, without cutting or displacing them.

It is never touched by passing trains, except when in use, preventing their running off the track. It is simple in its construction and operation, requiring only two Castings and two Rails; the latter, even if much worn or used, not objectionable.

Working Models of the Safety Switch may be seen at Messrs. Davenport and Bridges, Cambridgeport, Mass., and at the office of the Railroad Journal, New York.

Plans, Specifications, and all information obtained on application to the Subscriber, Inventor, and Patentee

**G. A. NICOLLS,**

Reading, Pa.

ja45

river, (of which firm the subscriber was late a partner) under the immediate supervision of Mr. Ray himself.

Several sets of trucks containing the latest improvements have recently been turned out for the New York and Erie railroad, and the New Jersey Transportation company, which may be seen upon said roads.

The patronage of Railroad Companies and Car Builders is respectfully solicited.

New York, May 4, 1846.

W. H. CALKINS, and Others.

To all whom it may concern:—This is to certify that the New Haven, Hartford and Springfield railroad co., have had in use six sets of F. M. Ray's patent trucks for the last 20 months, during which time it appears to me, they have proved to be the best and most economical truck now in use.

(Signed,)

WILLIAM ROE, Supt of Power.

I certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Philadelphia and Reading railroad for some time past, under a passenger car.

For simplicity of construction, economy in cost, lightness of material, and extreme ease of motion, I consider it the best truck we have ever used. Its peculiar make also renders it less liable to be thrown off the track, when passing over any obstruction. We intend using it extensively under the passenger and freight cars of the above road.

Reading, Pa., October 6, 1845.

(Signed,)

G. A. NICOLL,

Supt. Transportation, etc. Philadelphia and Reading Railroad.

To all whom it may concern:—This is to certify that the N. Jersey Railroad and Transportation company have used Fowler M. Ray's Truck for the last seven months, during which time it has operated to our entire satisfaction. I have no hesitation in saying that it is the simplest and most economical truck now in use.

(Signed,)

T. L. SMITH,

Jersey City, November 4, 1845.

N. Jersey Railroad and Transp. Co.

This is to certify that F. M. Ray's Patent Equalizing Railroad Truck has been in use on the Long Island railroad for the last year, under a freight car.

For simplicity of construction, economy in cost, lightness of material and ease of motion, I consider it equal to any truck we have in use.

Long Island Railroad Depot,

(Signed,)

JOHN LEACH,

Sup<sup>r</sup> Motive Power.

Jamaica November 12, 1845.

the sale of

Codorus,  
Glendon,  
Spring M. and  
Valley,

Pig Iron.

Have now a supply, and respectfully solicit the patronage of persons engaged in the making of Machinery, for which purpose the above makes of Pig Iron are particularly adapted.

They are also sole Agents for Watson's celebrated Fire Bricks and prepared Kaolin or Fire Clay orders for which are promptly supplied.

**SAM'L KIMBER & CO.,**

50 North Wharves,

Jan. 14, 1846.

[1y4]

Philadelphia, Pa.

**TO RAILROAD COMPANIES AND MANUFACTURERS** of railroad Machinery. The subscribers have for sale Am. and English bar iron, of all sizes; English blister, cast, shear and spring steel; Juniata rods; car axles, made of double refined iron; sheet and boiler iron, cut to pattern; tiers for locomotive engines, and other railroad carriage wheels, made from common and double refined E. O. iron; the latter a very superior article. The tires are made by Messrs. Baldwin & Whitney, locomotive engine manufacturers of this city. Orders addressed to them, or to us, will be promptly executed.

When the exact diameter of the wheel is stated in the order, a fit to those wheels is guaranteed, saving to the purchaser the expense of turning them out inside.

**THOMAS & EDMUND GEORGE,**

245 N. E. cor. 12th and Market sts., Philad., Pa.

**TO LOCOMOTIVE AND MARINE ENGINE BOILER BUILDERS.** Pascal Iron Works, Philadelphia. Welded Wrought Iron Flues, suitable for Locomotives, Marine and other Steam Engine Boilers, from 2 to 5 inches in diameter. Also, Pipes for Gas, Steam and other purposes; extra strong Tube for Hydraulic Presses; Hollow Pistons for Pumps of Steam Engines, etc. Manufacture: and for sale by

**MORRIS TASKER & MORRIS,**

Warehouse S. E. corner 3d and Walnut Sts., Philadelphia.

**THE SUBSCRIBER IS PREPARED TO** execute at the Trenton Iron Works, orders for Railroad Iron of any required pattern, and warranted equal in every respect in point of quality to the best American or imported Rails. Also on hand and made to order, Bar Iron, Braziers' and Wire Rods, etc., etc.

**PETER COOPER** 17 Burling Slip.

1y10

New York.

# NORRIS' LOCOMOTIVE WORKS.

BUSHHILL, SCHUYLKILL SIXTH-ST., PHILADELPHIA,

**M**ANUFACTURE to order Locomotive Steam Engines of every plan or size. Their shops being enlarged, and their arrangements considerably extended to facilitate the speedy execution of work in this branch, they can offer to Railway Companies unusual advantages for prompt delivery of Machinery of superior workmanship and finish. Connected with the Locomotive business, they are also prepared to furnish, at short notice, Chilled Wheels for Cars of superior quality. Iron and Brass castings, Axles, etc., fitted up complete with Trucks or otherwise.

**L**AP-WELDED WROUGHT IRON TUBES for Tubular Boilers, from 14 to 15 inches diameter, and any length not exceeding 17 feet—manufactured by the Caledonian Tube Company, Glasgow, and for sale by

IRVING VAN WART,  
12 Platt street, New York.  
JOB CUTLER, Patentee.

These Tubes are extensively used by the British Government, and by the principal Engineers and Steam Marine and Railway Companies in the Kingdom. 284

**S**PRING STEEL FOR LOCOMOTIVES, Tenders and Cars. The Subscriber is engaged in manufacturing Spring Steel from 14 to 6 inches in width, and of any thickness required: large quantities are yearly furnished for railroad purposes, and wherever used, its quality has been approved of. The establishment being large, can execute orders with great promptitude, at reasonable prices, and the quality warranted. Address

JOAN F. WINSLOW, Agent,  
Albany Iron and Nail Works,

**T**HE SUBSCRIBERS ARE PREPARED TO execute orders at their Phoenix Works for Railroad Iron of any required pattern, equal in quality and finish to the best imported. 285

REEVES, BUCK & CO.,  
Philadelphia.  
ROBERT NICHOLS, Agent,  
No. 79 Water St., New York.

**P**ATENT INDESTRUCTIBLE WATER Pipes. The subscribers continue to manufacture the above Pipes, of all the sizes and strength required for City or Country use, and would invite individuals or companies to examine its merits.—This pipe, unlike cast iron and lead, imparts neither color, oxide or taste, being formed of strongly riveted sheet iron, and evenly lined on the inside with hydraulic cement. While in the process of laying, it has a thick covering externally of the same—thus forming nature's own conduit of stone. The iron being thoroughly encased on both sides with cement, precludes the possibility of rust or decay, and renders the pipe truly indestructible. The prices are less than those of iron or lead. We also manufacture Basins and D. Traps, for Water Closets, on a new principle, which we wish the public to examine at 112 Fulton street, New York. 286

**SOUTH CAROLINA RAILROAD.**

A Passenger Train runs daily from Charleston, on the arrival of the boats from

Wilmington, N. C., in connection with trains on the Georgia, and Western and Atlantic Railroads—and by stage lines and steamers connects with the Montgomery and West Point, and the Tuscumbia Railroad in N. Alabama.

Fare through from Charleston to Montgomery daily \$26 50

Fare through from Charleston to Huntsville, Decatur and Tuscumbia 29 00

The South Carolina Railroad Co. engage to receive merchandise consigned to their order, and to forward the same to any point on their road; and to the different stations on the Georgia and Western and Atlantic railroad; and to Montgomery, Ala., by the West Point and Montgomery Railroad.

JOHN KING, Jr., Agent.

**THE WESTERN AND ATLANTIC**

Railroad.—This Road is now in operation to Oothcaloga; a distance of 80 miles, and connects daily (Sundays excepted) with the Georgia Railroad.

From Kingston, on this road, there is a tri-weekly line of stages, which leave on the arrival of the cars on Tuesday, Thursday and Saturday, for Warrenton, Huntsville, Decatur and Tuscumbia, Alabama, and Memphis, Tennessee.

On the same days, the stages leave Oothcaloga for Chattanooga, Jasper, Murfreesborough, Knoxville and Nashville, Tennessee.

This is the most expeditious route from the east to any of these places.

CHAS. F. M. GARNETT, Chief Engineer.

Atlanta, Georgia, April 16th, 1846. 1y1

**NEW YORK AND PHILADELPHIA RAILROAD**

line—direct. Via Newark, New Brunswick, Princeton, Trenton, and Bristol. (Through in six hours.) Leaving New York daily from the foot of Liberty street.

Morning line 9 o'clock a.m.

Mail pilot line 4½ p.m.

The lines proceed direct to Bristol without change of cars, and thence by the new steamer, "John Stevens," to Philadelphia.

**FARE BETWEEN NEW YORK & PHILA.**

First class cars \$4 00

Second class cars 3 00

Passengers will procure their Tickets at the office foot of Liberty st., where a commodious steamboat will be in readiness with Baggage-crates on board.

Fifty pounds of baggage will be allowed to each passenger in this line, and passengers are expressly prohibited from taking anything as baggage but their wearing apparel, which will be at the risk of the owner.

Philadelphia Baggage-crates are conveyed from city to city, without being opened by the way. Each train is provided with a car, in which are apartments and dressing rooms expressly for ladies' use.

Returning, the lines leave Philadelphia from the foot of Walnut st. at 9 a.m., and 4 1-2 p.m.

The lines for Baltimore leave Philadelphia daily except Sundays, at 8 a.m., 3½ and 10 p.m., and Saturdays only at 10 p.m.—being a continuation of the line from New York.

254

# FRANKLIN HOUSE,

No. 105 Chestnut Street, Philadelphia.

The undersigned takes the liberty of calling the attention of the readers of the Journal to the fact that the Office is removed from New York to the FRANKLIN HOUSE, Philadelphia, where he will be always pleased to meet and greet them. They will not only find a pleasant Reading Room, with lots of foreign periodicals, treating of Railroads and Machinery, but they will always find good-sized and airy rooms—clean beds—and a well supplied table. If they would have further proof of this, they have only to call, and judge for themselves, and much oblige the proprietor, D. K. MINOR.

# BOUND VOLUMES.

Volumes of this Journal, for the Years 1838 to 1846, INCLUSIVE, may be had Bound, at Subscription Price, on application at this Office.

One or two COMPLETE SETS of the RAILROAD JOURNAL may be had in a few weeks—or as soon as two numbers can be reprinted—by application to the Editor.

# AMERICAN RAILROAD JOURNAL.

OFFICE AT THE FRANKLIN HOUSE,

105 Chestnut Street,

PHILADELPHIA, PA.

This is the only periodical having a general circulation throughout the Union, in which all matters connected with public works can be brought to the notice of all persons in any way interested in these undertakings. Hence it offers peculiar advantages for advertising times of departure, rates of fare and freight, improvements in machinery, materials, as iron, timber, stone, cement, etc. It is also the best medium for advertising contracts, and placing the merits of new undertakings fairly before the public.

TERMS.—Five Dollars a year, in advance.
